Client-Server Model

Communication between web **clients** and web **servers**.

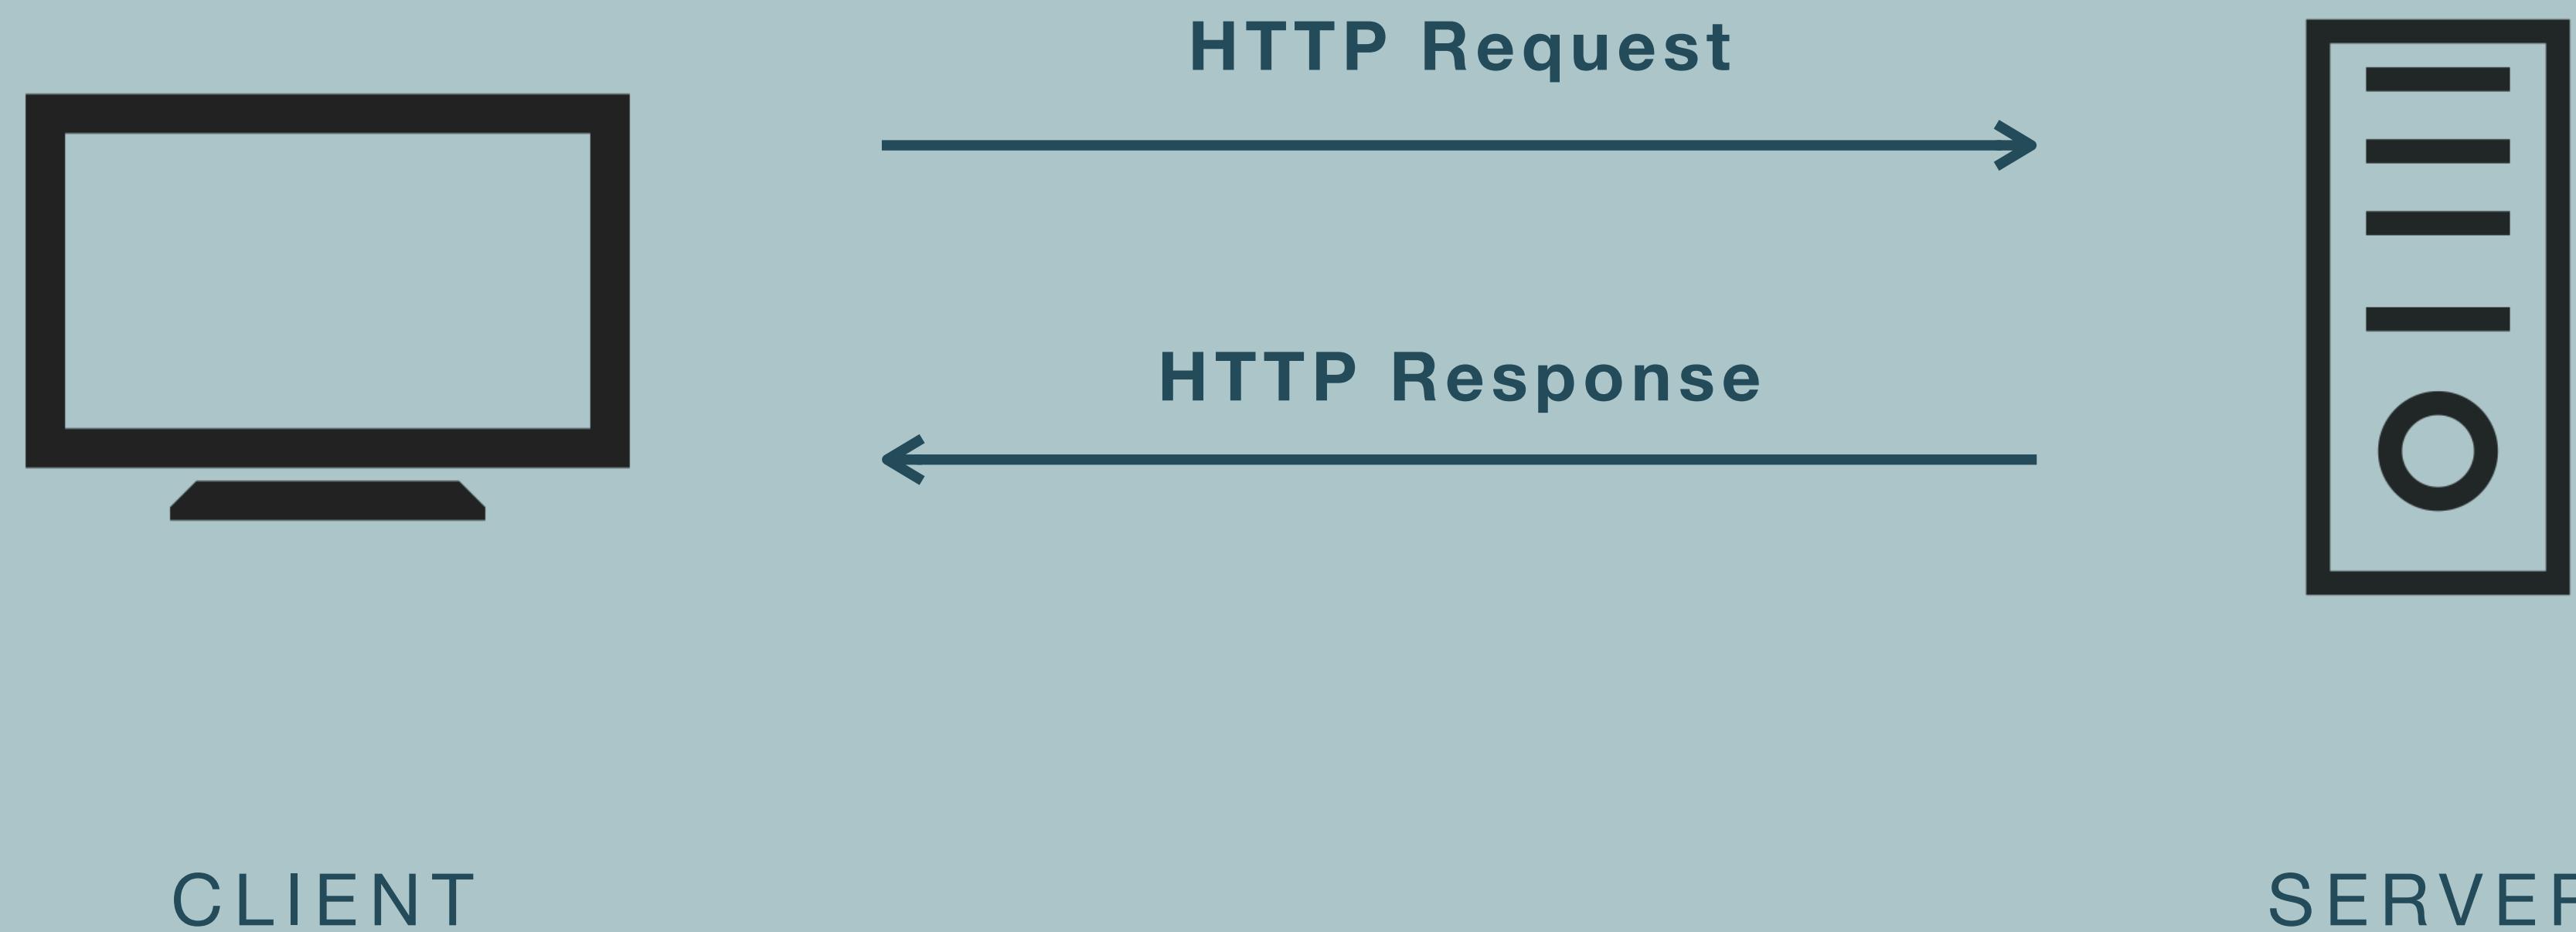

Client-Server Model

Communication between web **clients** and web **servers**.

Client-Server Model

Communication between web **clients** and web **servers**.

Hyper Text Transfer Protocol

- A protocol and standard for fetching data, HTML and other resources (text, images, videos, scripts, JSON).
- The foundation of the web.

What is HTTP

Not Secure | w3schools.com/whatis/whatis_http.asp

HTML CSS JAVASCRIPT SQL PYTHON

HTTP Request / Response

Communication between clients and servers is done by **requests** and **responses**:

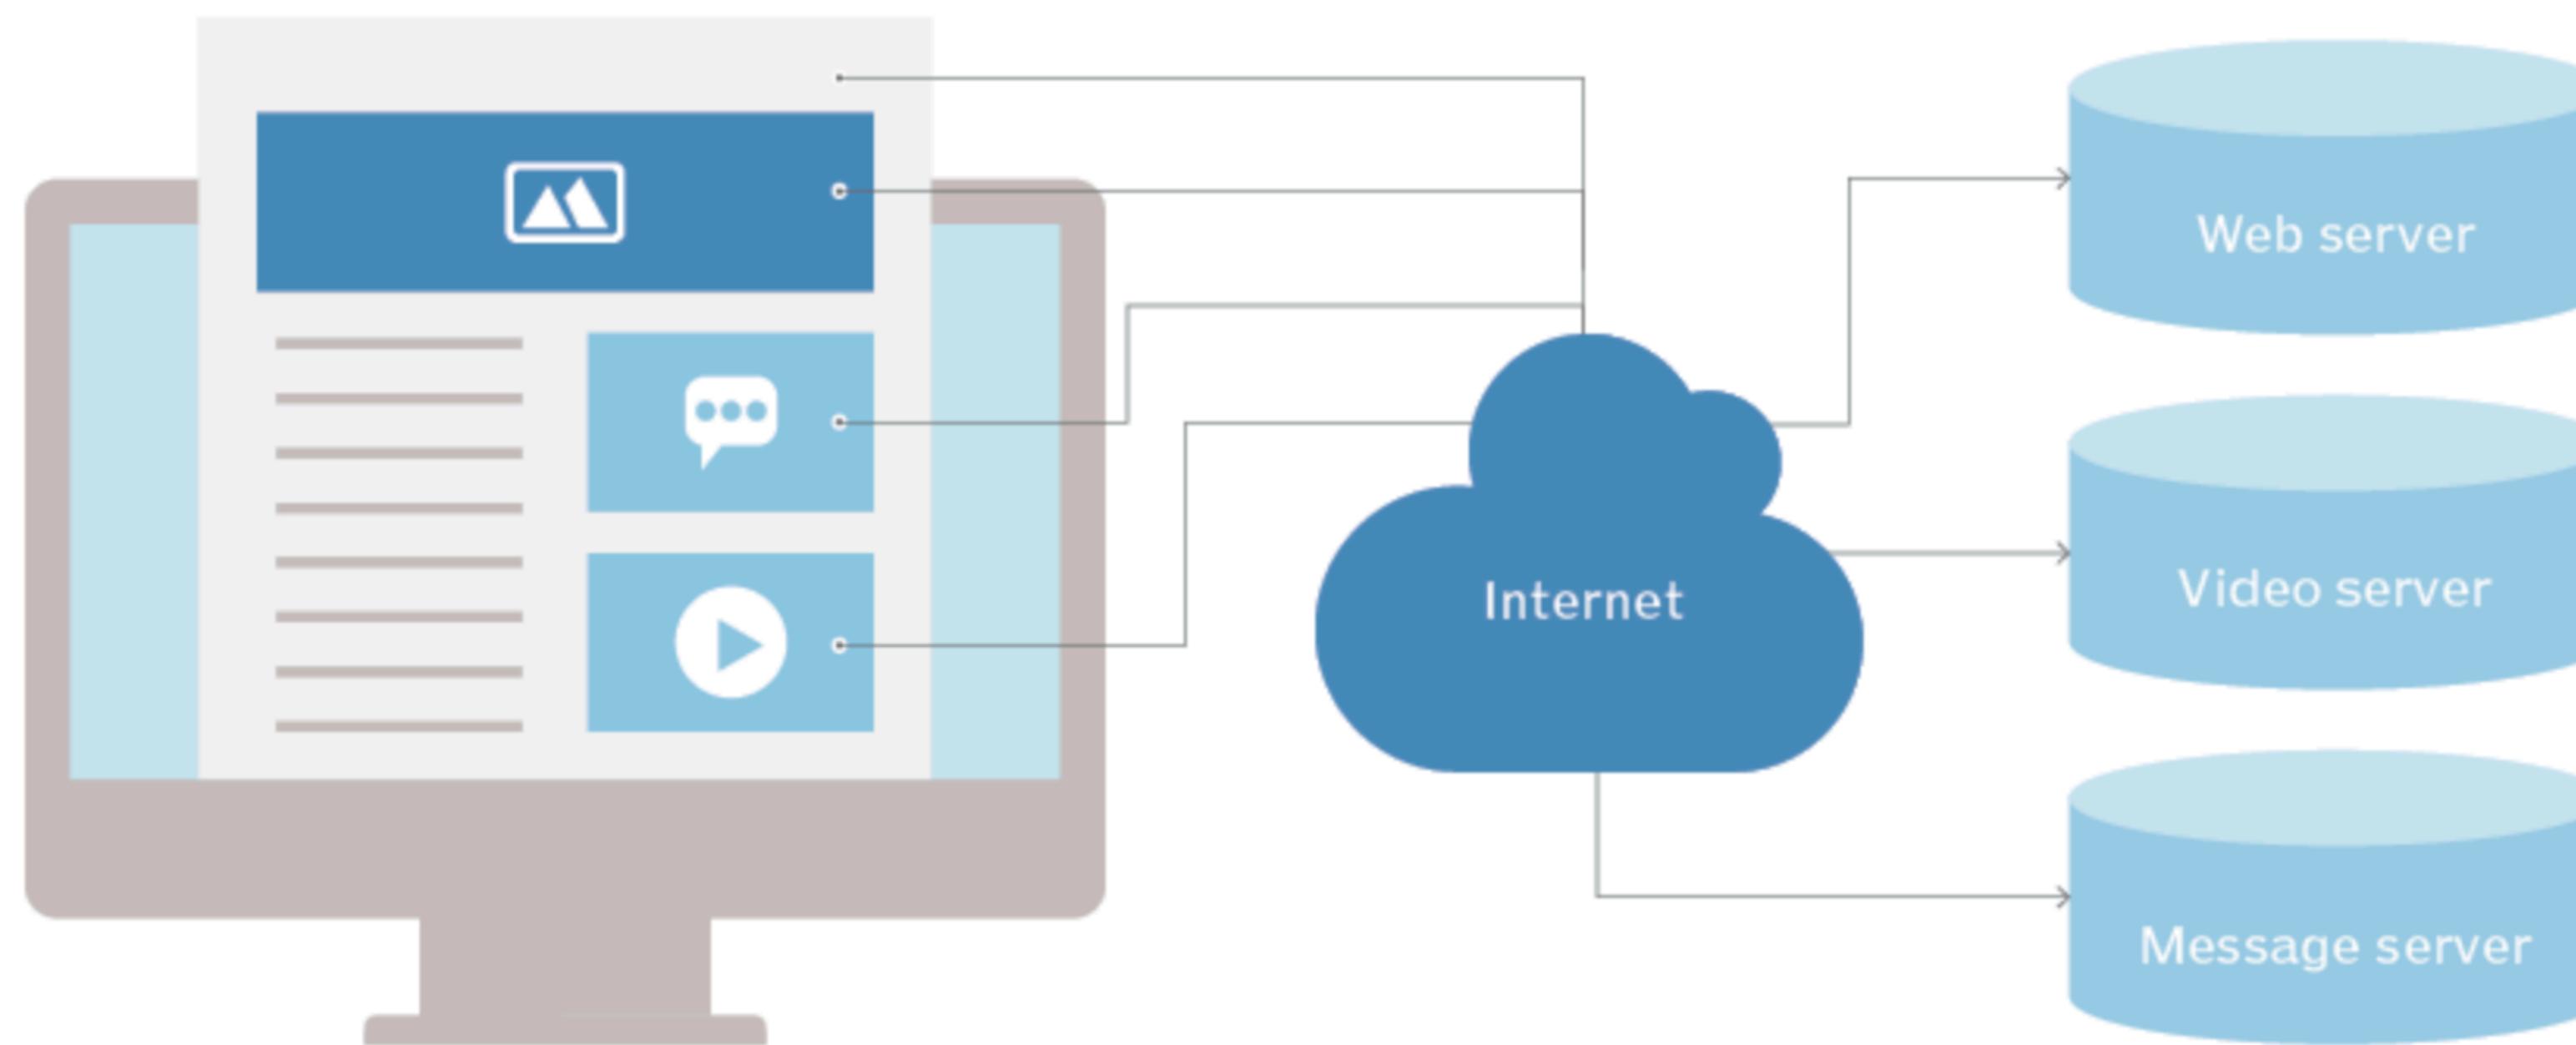

1. A client (a browser) sends an **HTTP request** to the web
2. A web server receives the request
3. The server runs an application to process the request
4. The server returns an **HTTP response** (output) to the browser
5. The client (the browser) receives the response

The HTTP Request Circle

A typical HTTP request / response circle:

1. The browser requests an HTML page. The server returns an HTML file.
2. The browser requests a style sheet. The server returns a CSS file.
3. The browser requests an JPG image. The server returns a JPG file.
4. The browser requests JavaScript code. The server returns a JS file
5. The browser requests data. The server returns data (in XML or JSON).

How HTTP Works

<https://www.techtarget.com/whatis/definition/HTTP-Hypertext-Transfer-Protocol>

Network Tab

The screenshot shows a web browser window with the URL kompetence.kea.dk/kurser-fag/webudvikling-frontend. The main content area displays information about the 'WEBUDVIKLING FRONTEND' course, including a 'SE HOLDSTART OG TILMELD DIG →' button and a 'LAV DIN EGEN PDF-BROCHURE' section with a 'FØJ TIL PDF' button. A red sidebar on the left contains a 'NY UDDANNELSE: DIPLOM I WEBUDVIKLING' section with text about the diploma program.

Network Tab Details:

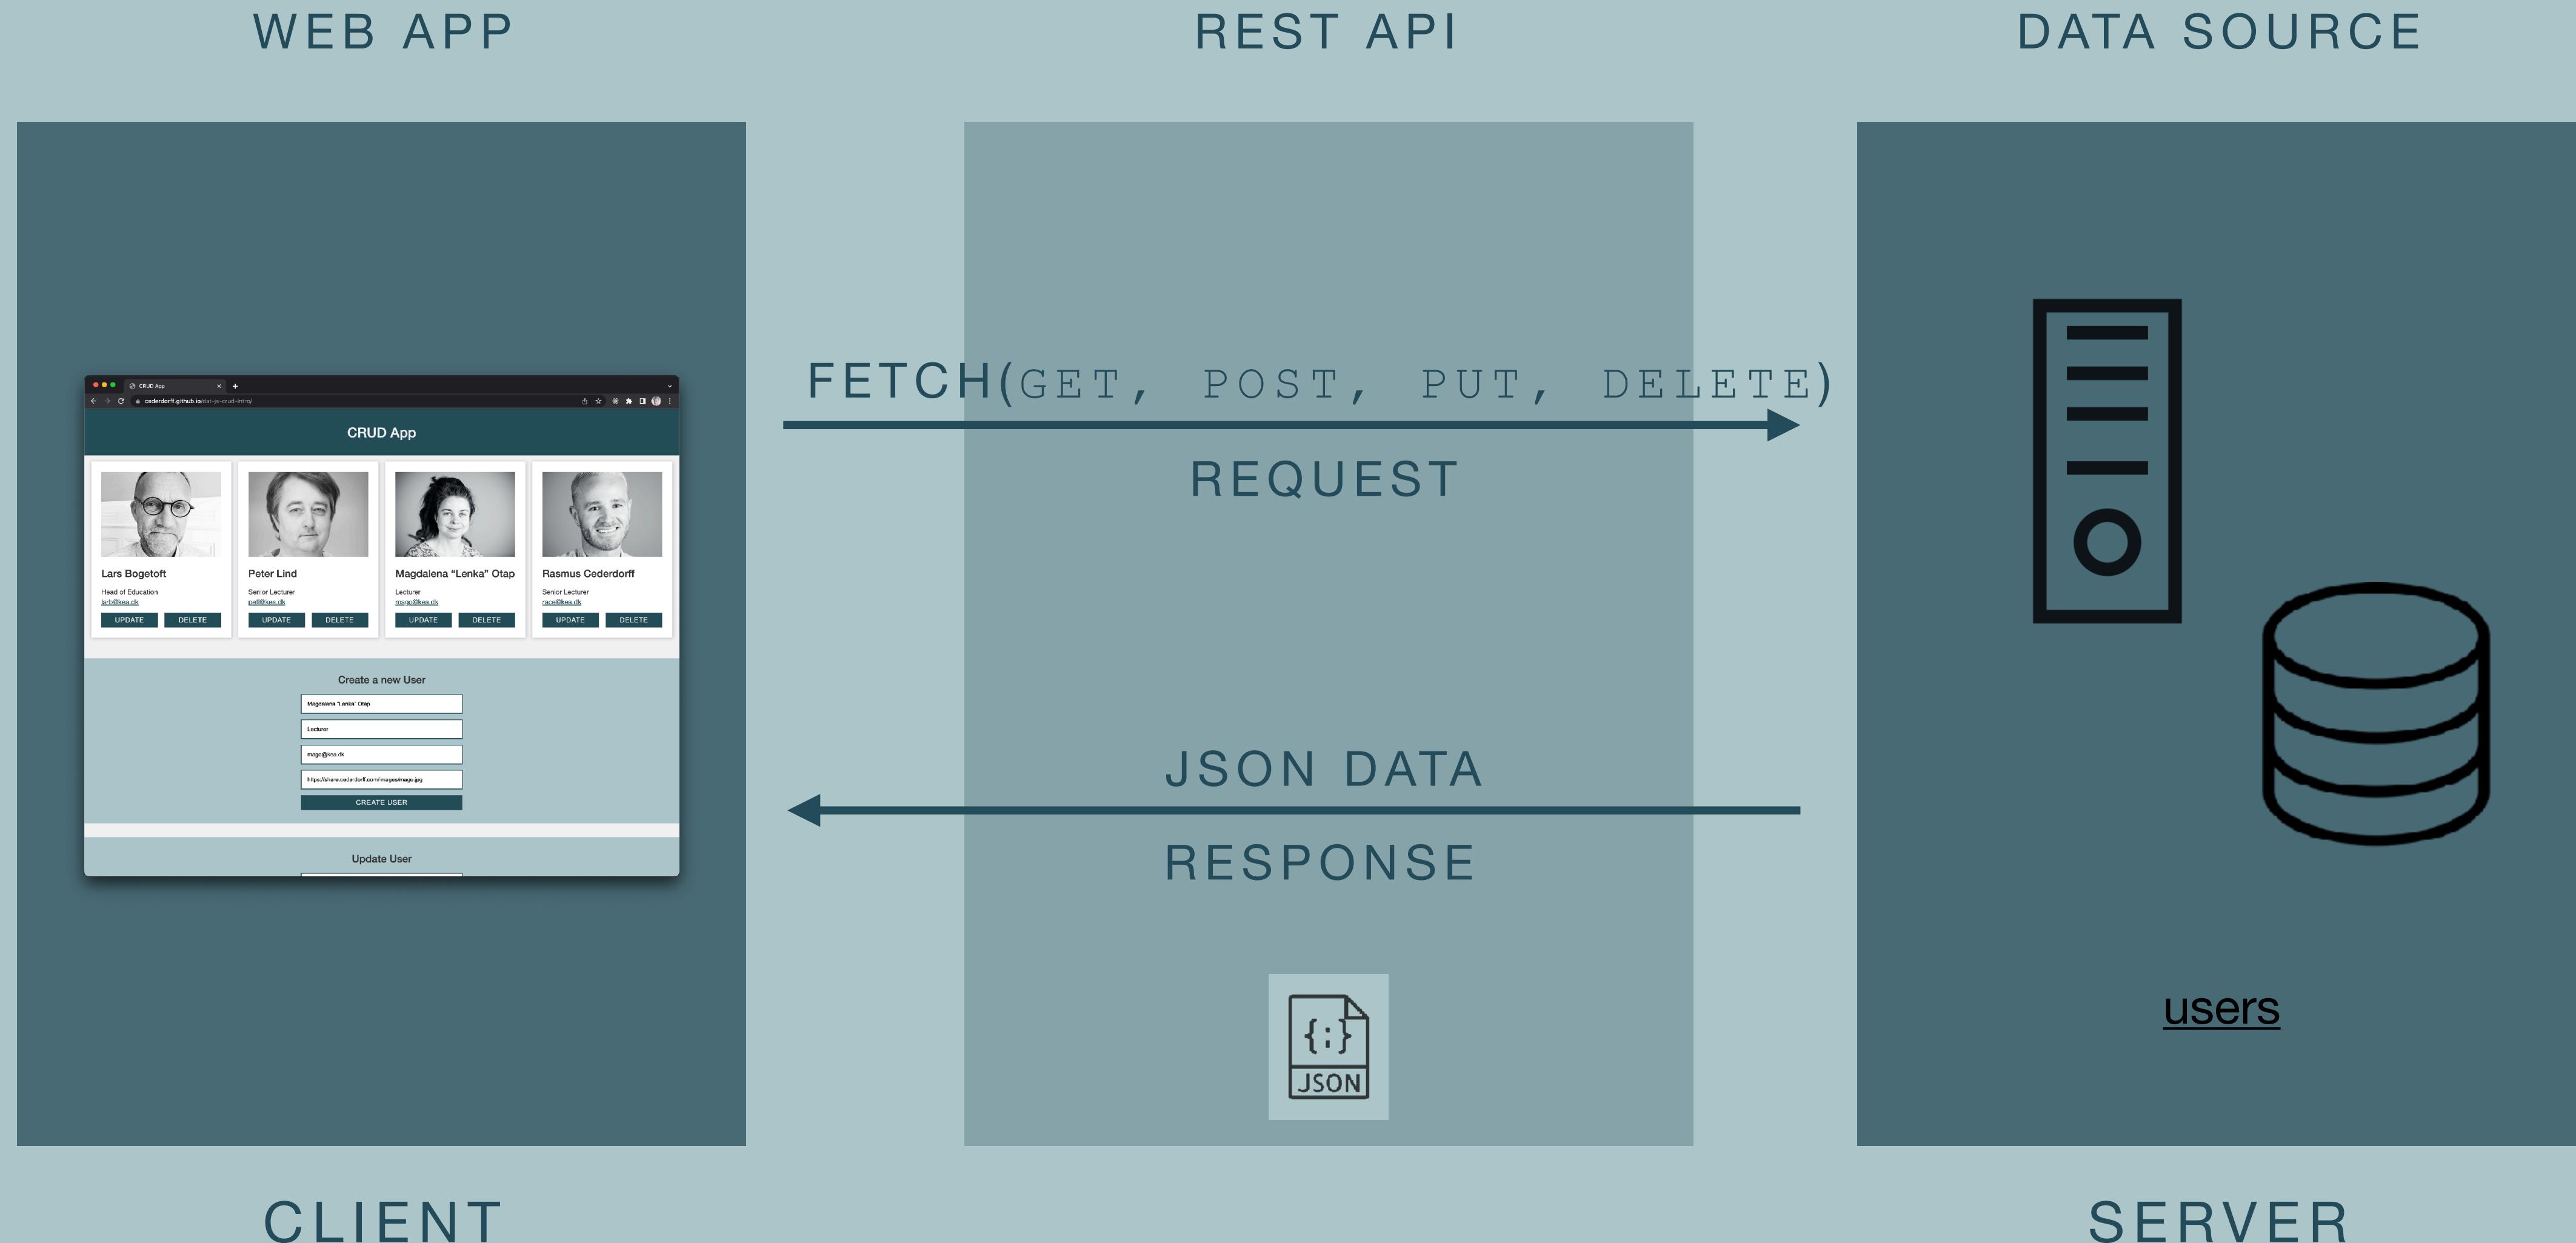

- Filter:** All | Fetch/XHR | JS | CSS | Img | Media | Font | Doc | WS | Wasm | Manifest | Other
- Has blocked cookies:**
- Blocked Requests:**
- 3rd-party requests:**
- Timeline:** 500 ms, 1000 ms, 1500 ms, 2000 ms
- Table Headers:** Name, Status, Type, Initiator, Size, Time, Waterfall
- Table Data:** A list of 46 requests, mostly 200 status, including files like 'webudvikling-fro...', 'quixtrap.css', 'quix.css', 'jquery.min.js?77...', 'style.css?77958...', etc.
- Metrics:** 46 requests | 28.7 kB transferred | 1.9 MB resources | Finish: 1.59 s | DOMContentLoaded

- Brug Network-tabben til at undersøge et website (fx kea.dk, dr.dk, google.dk, react-rest-and-auth.web.app eller et helt andet).
- Åben websitet i Chrome (eller en anden browser).
- Åben Developer Tool (se: [How to open the dev tool in your browser](#)) og gå til Network/Netværk.
- Genindlæs siden imens du står i Network-tabben og undersøg hvilke ressourcer, der bliver hentet.
- Hvilke(n) type ressourcer er der tale om?
- Overvej hvordan ressourcerne hentes.

JSON Data Source (Server)

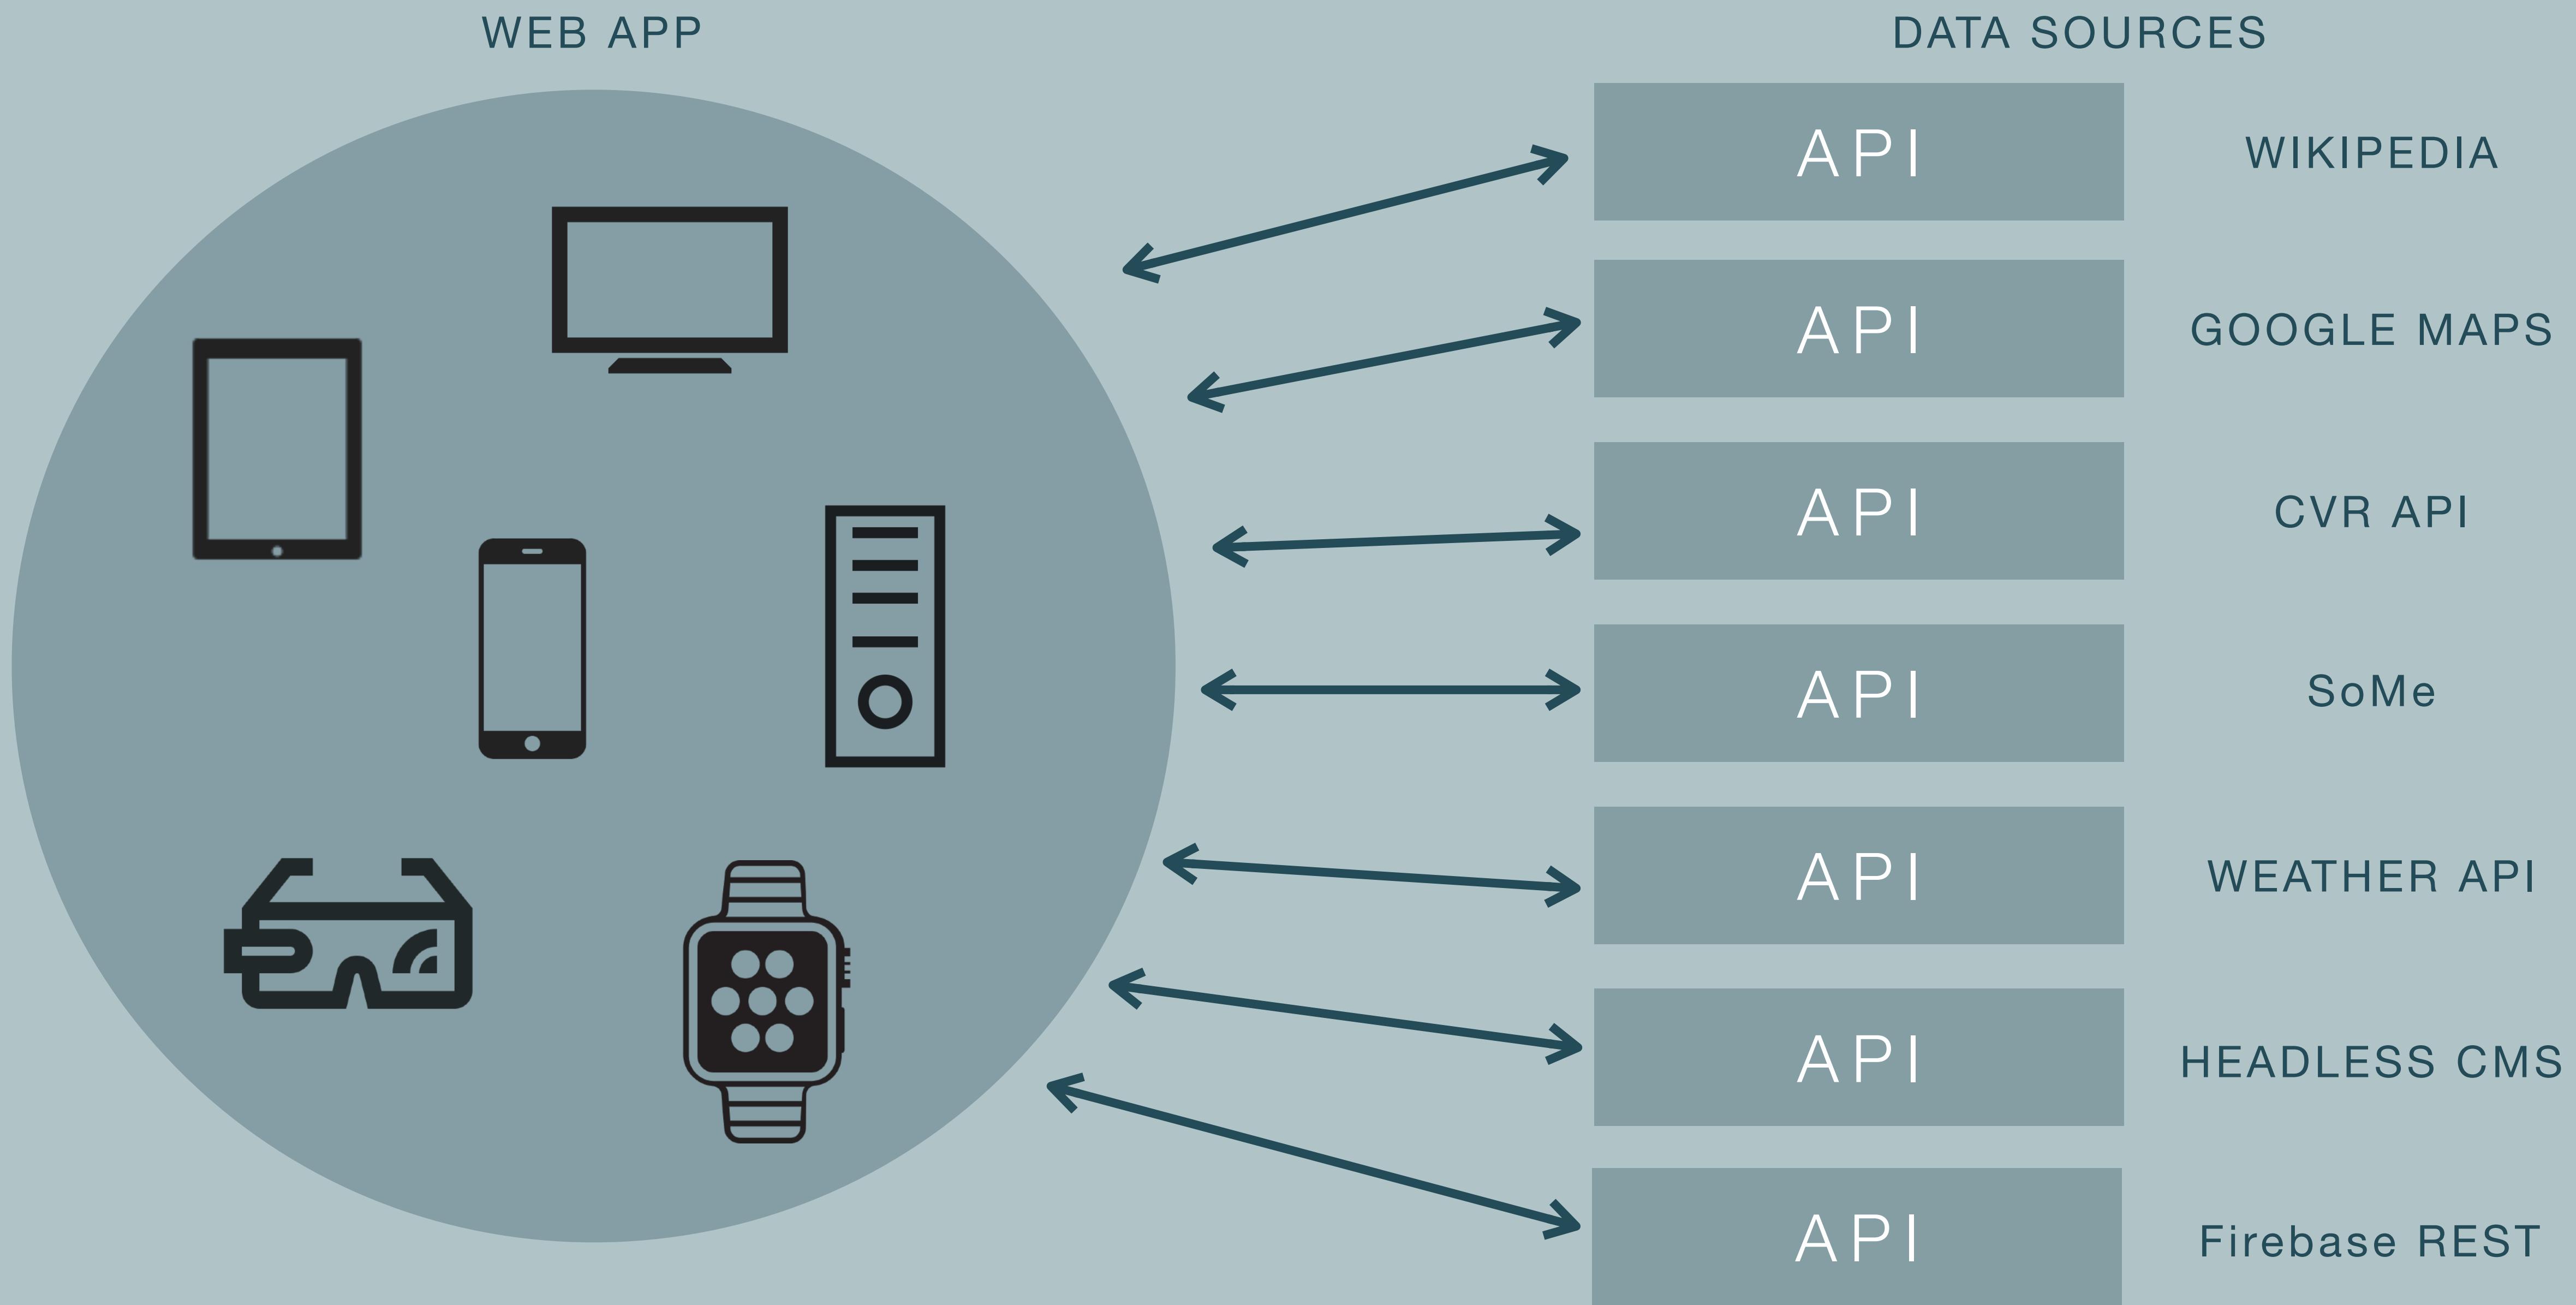

A screenshot of a browser window displaying a JSON file. The URL is <https://raw.githubusercontent.com/cederdorff/dat-js/main/data/potter.json>. The JSON structure defines characters with their names, species (all are human), gender, house, date of birth, year of birth, ancestry, eye color, hair color, and wand details. The "Raw" tab shows the raw JSON code, and the "Parsed" tab shows the JSON data as a tree structure.

```
Raw
{
  "name": "Harry Potter",
  "species": "human",
  "gender": "male",
  "house": "Gryffindor",
  "dateOfBirth": "31-07-1980",
  "yearOfBirth": 1980,
  "ancestry": "half-blood",

API

Web Development

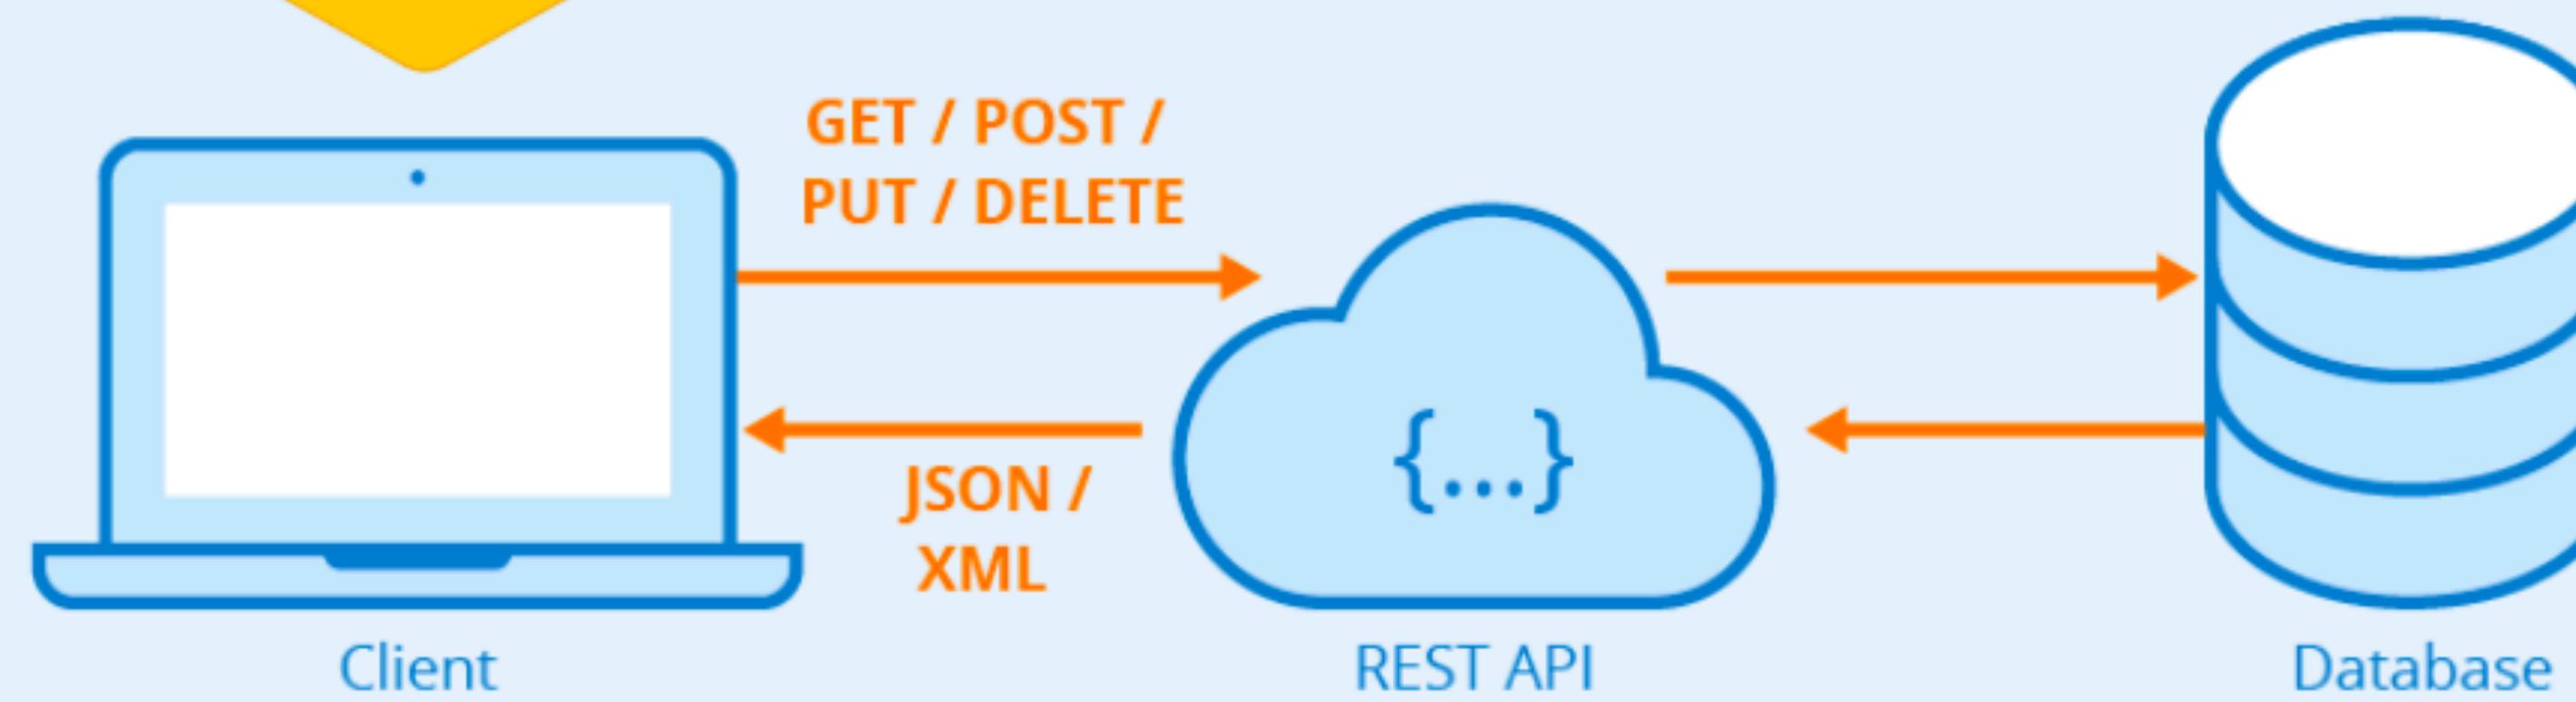

When someone asks you how to get data from a database in a js code

made with mematic

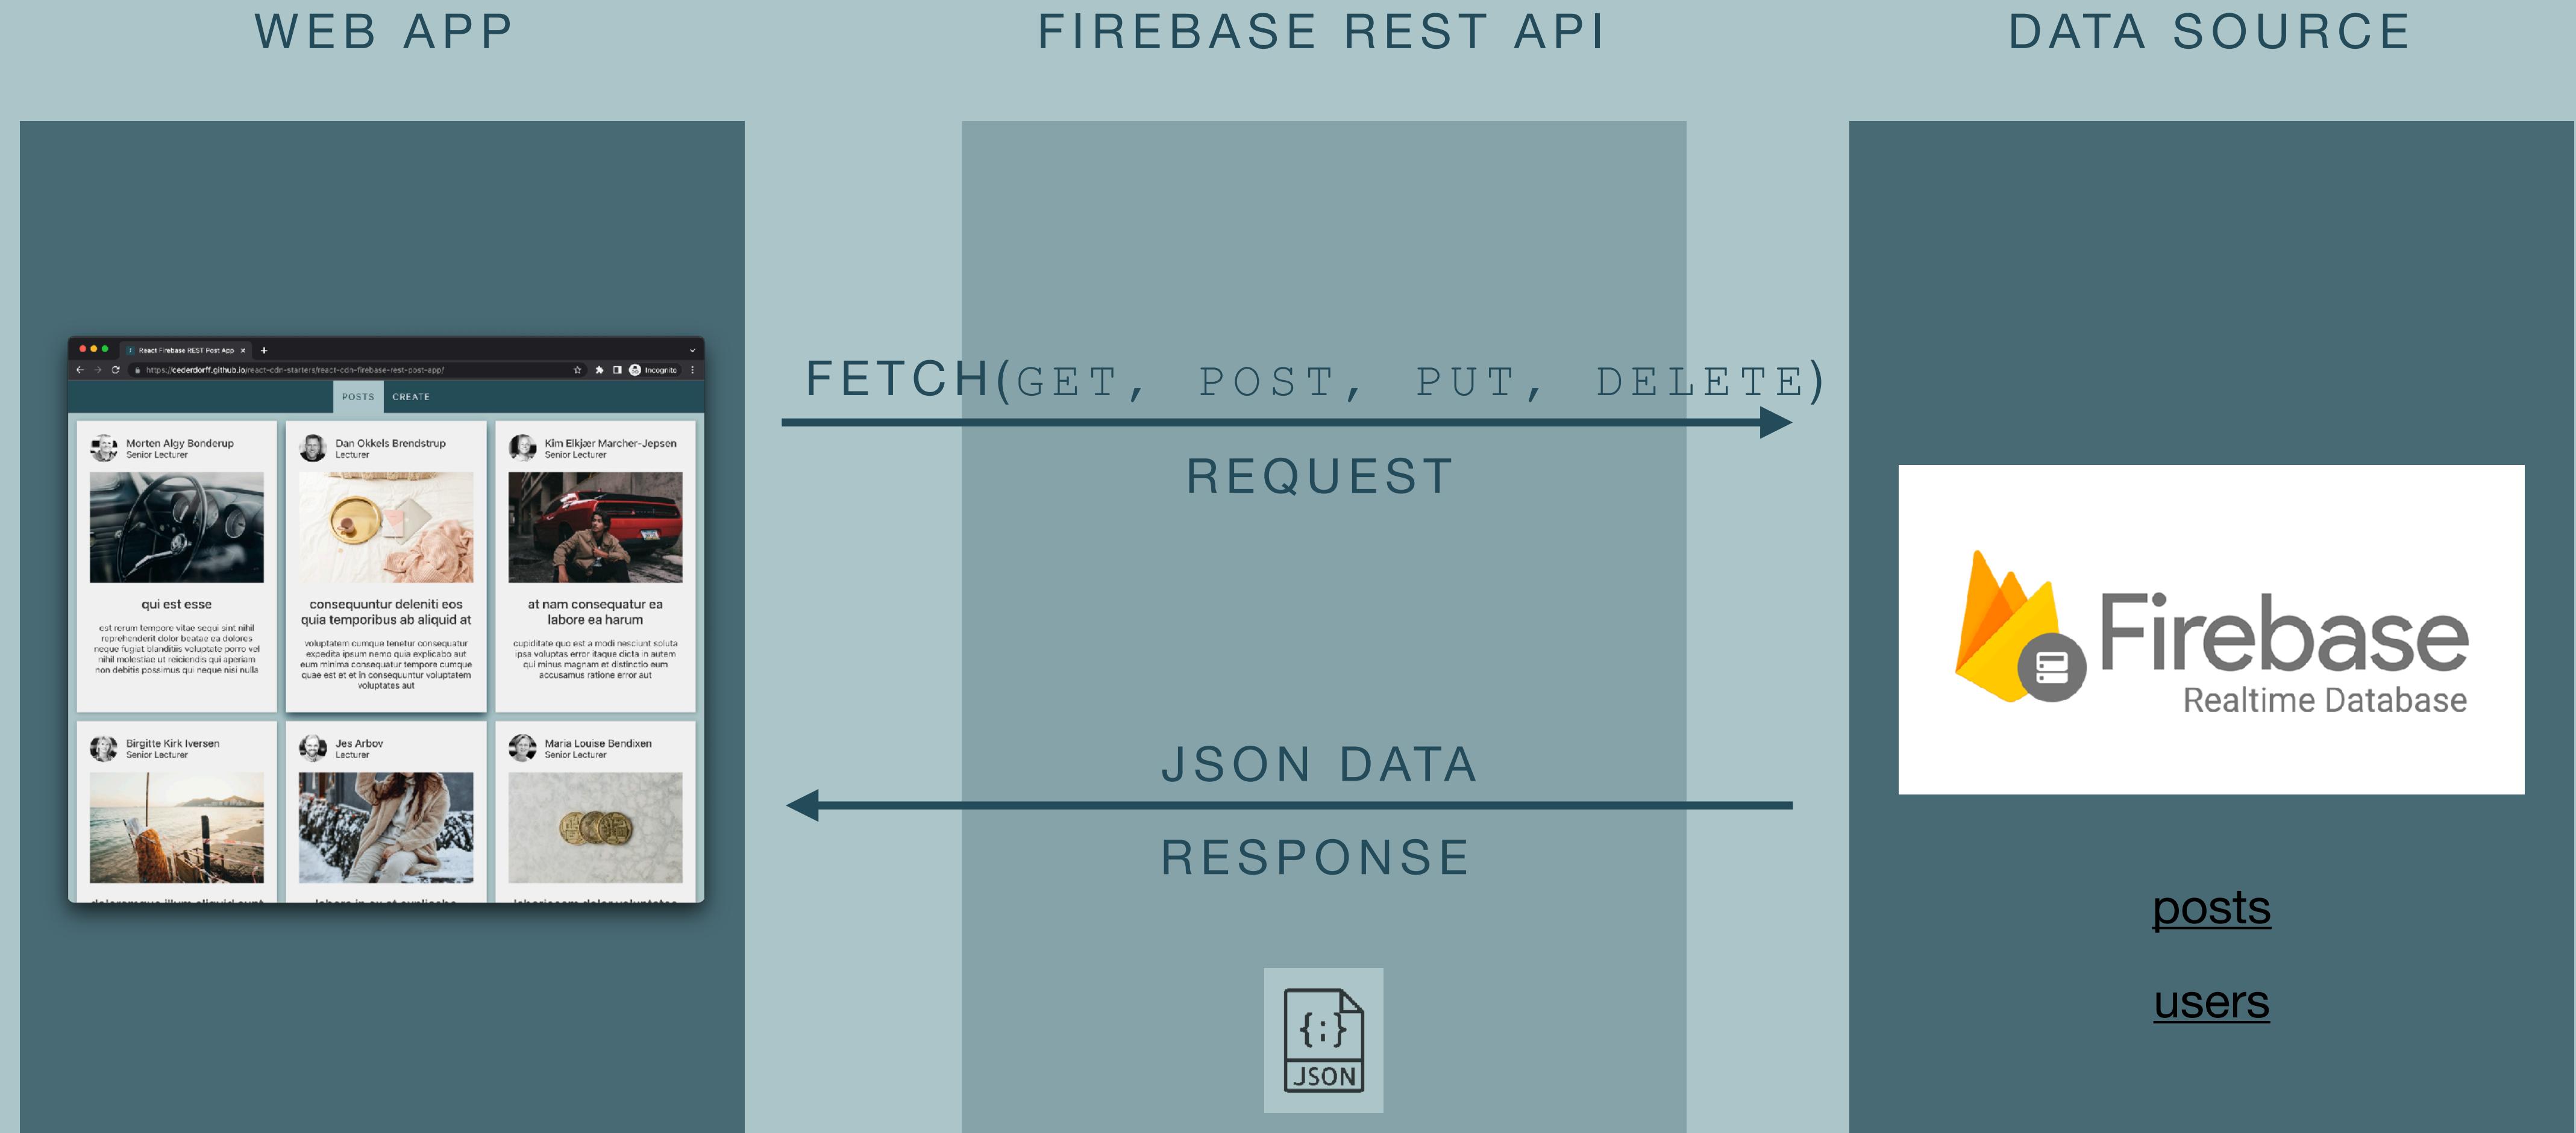

Firebase

Fetch, HTTP Request & Response

fetch(...)

HTTP Requests in
JavaScript.

A way to get and post data
from and to data sources.

```
// fetch with callbacks
fetch("https://cederdorff.github.io/web-frontend/callback.js")
  .then(function (response) {
    return response.json();
  })
  .then(function (data) {
    console.log(data);
  });
// or with promises
const response = fetch("https://cederdorff.github.io/web-frontend/promise.js");
const data = response.json();
console.log(data);
```

fetch(...)

HTTP Requests in
JavaScript.

A way to get and post data
from and to data sources.

getCharacters fetches a list of characters
from a JSON data source, parses the JSON
to JS and returns the data.

```
async function getCharacters() {  
  const response = await fetch(url);  
  const data = await response.json();  
  console.log(data);  
  return data;  
}
```

fetch(...)

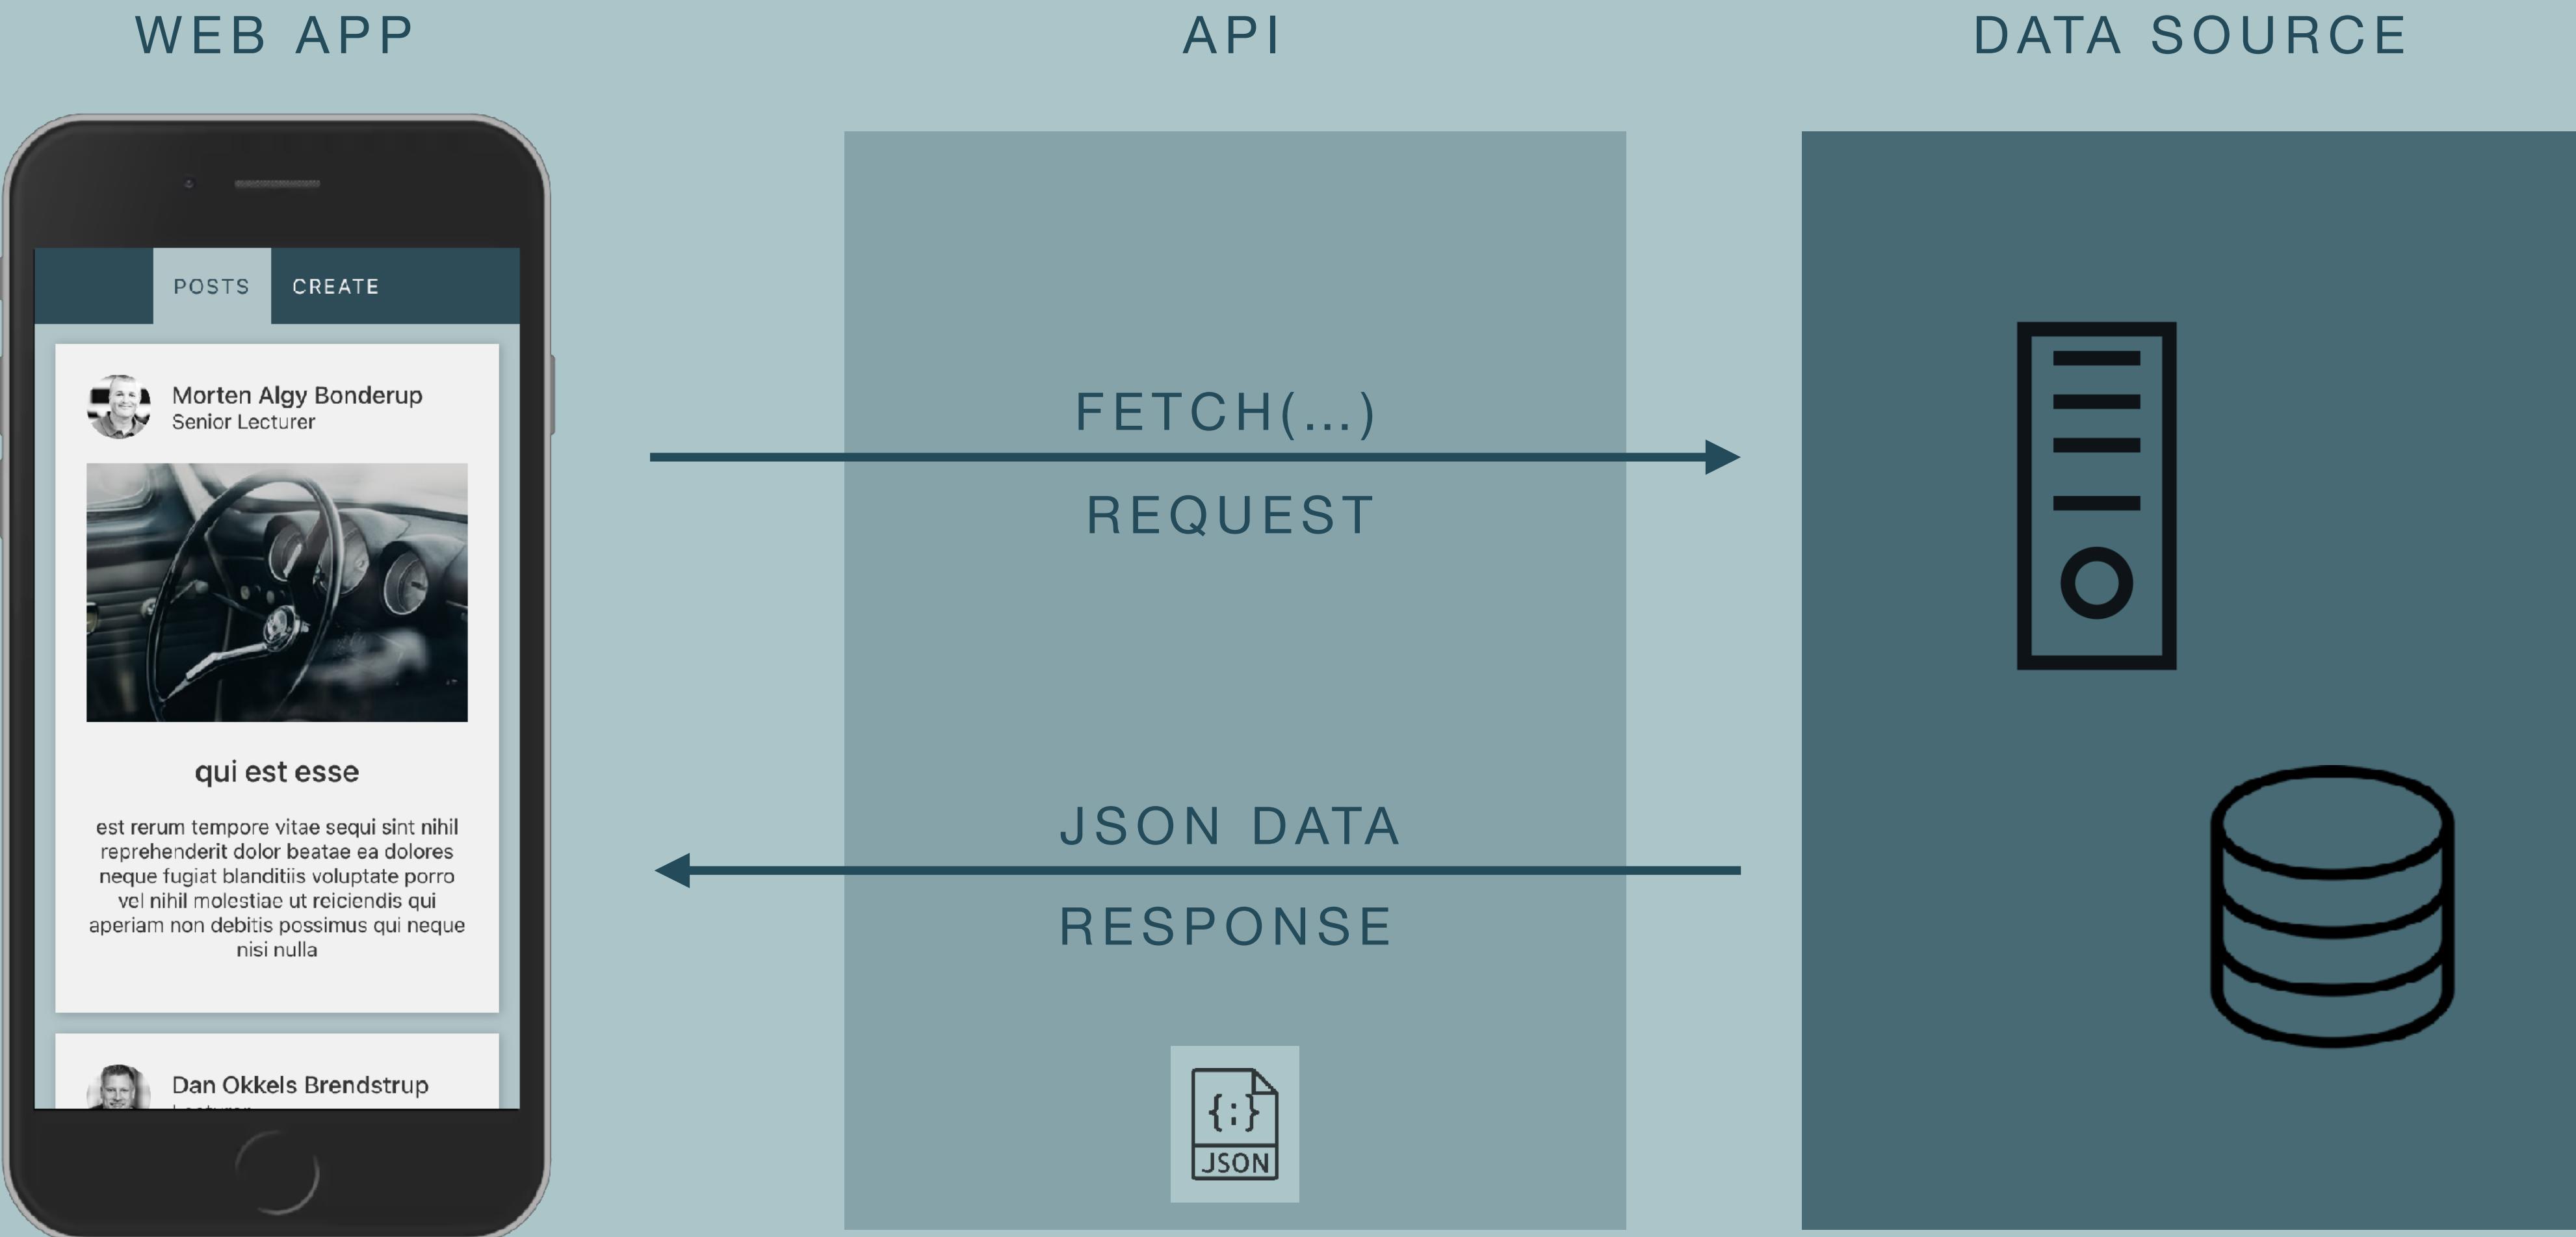

... get & post data from and to a data source
... can perform network requests to a server

```
1 let promise = fetch(url, [options])
```

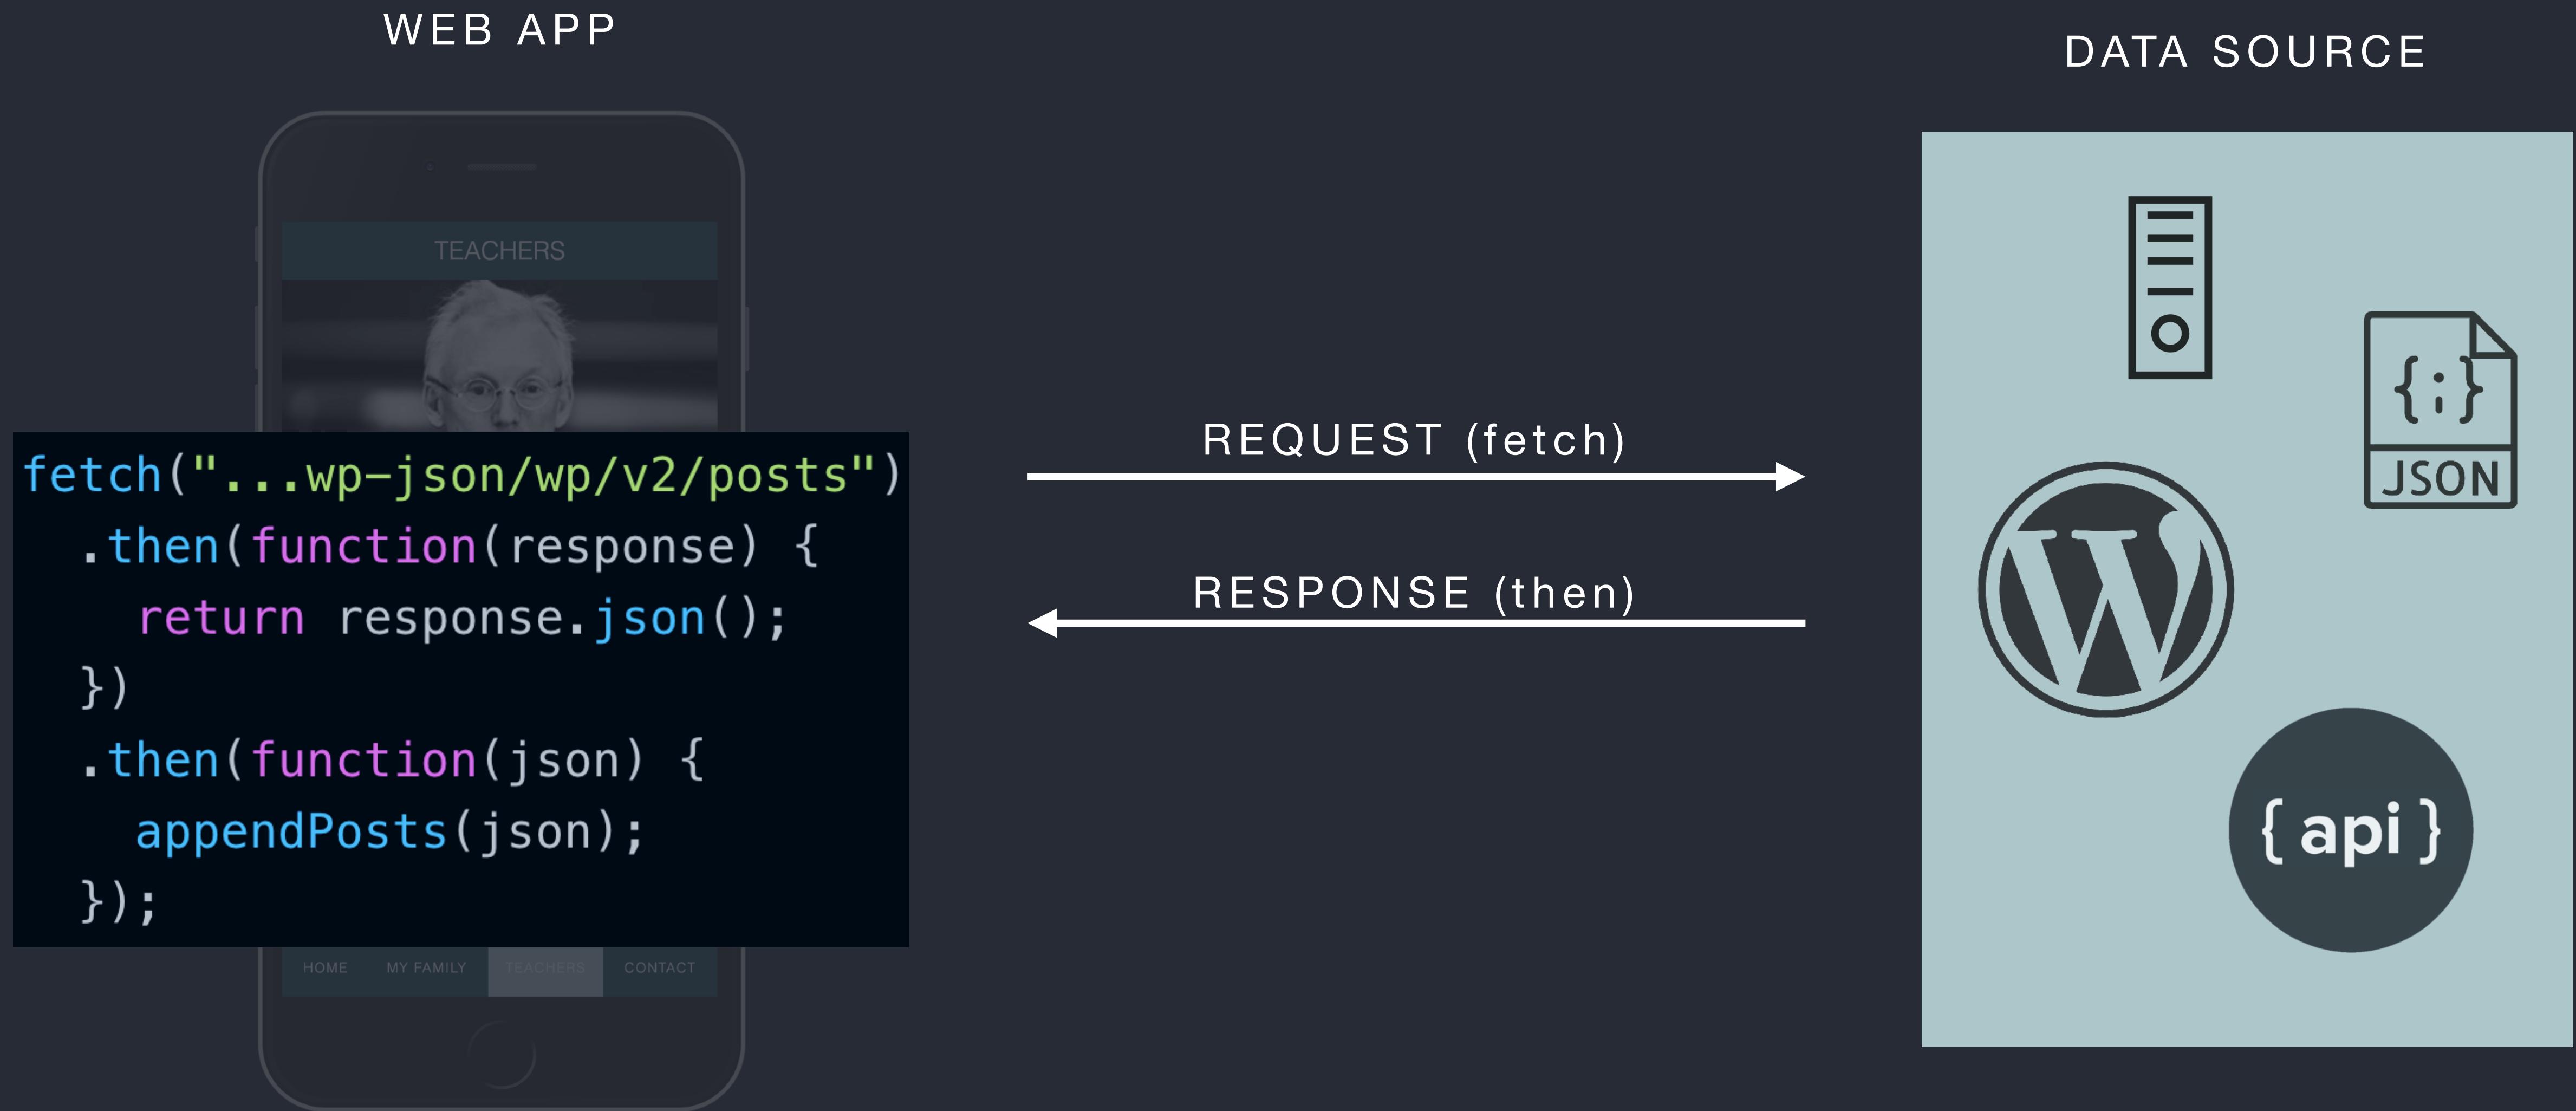

- `url` – the URL to access.
- `options` – optional parameters: method, headers etc.

Without `options`, this is a simple GET request, downloading the contents of the `url`.

Fetch, fetch, fetch

Fetch

```

/*
Fetches json data from the file persons.json
*/
fetch('json/persons.json')
  .then(function (response) {
    return response.json();
  })
  .then(function (jsonData) {
    console.log(jsonData);
    appendPersons(jsonData)
  });

/*
Appends json data to the DOM
*/
function appendPersons(persons) {
  let htmlTemplate = "";
  for (let person of persons) {
    htmlTemplate += /*html*/
      `

        <h4>${person.name}</h4>
        <p>${person.age} years old</p>
        <p>Hair color: ${person.hairColor}</p>
        <p>Relation: ${person.relation}</p>

`;
  }
  document.querySelector("#persons").innerHTML = htmlTemplate;
}

```

```

23     }
24     // set grid container content with person <article> elements
25     // saved in html
26     document.querySelector("#content").innerHTML = html;
27 }
28
29 getPerson(); // execute get persons to start the fun
30

```

Ln 1, Col 1 Spaces: 4 UTF-8 LF {} JavaScript Go Live ✓ Prettier

The diagram illustrates the flow of data. A curved arrow originates from the URL in the fetch statement at line 5 of the app.js code and points to the JSON response shown in the browser window. Another curved arrow originates from the JSON response in the browser and points back to the app.js code, specifically to the line where the response is converted to a global variable.

A screenshot of a browser window showing the JSON response from the fetch request. The URL is `https://raw.githubusercontent.com/cederdorff/web-diplom-frontend/main/_data/persons.json`. The response is a JSON array containing eight objects, each representing a person with properties: name, mail, title, and img.

```
[{"name": "Birgitte Kirk Iversen", "mail": "bkj@mail.dk", "title": "Senior Lecturer", "img": "https://www.eaaa.dk/media/u4gorzsd/birgitte-kirk-iversen2.jpg?width=800&height=450"}, {"name": "Martin Aagaard N\u00f8hr", "mail": "mnor@mail.dk", "title": "Lecturer", "img": "https://www.eaaa.dk/media/oayjq02h/martin-n%C3%B8hr.jpg?width=800&height=450"}, {"name": "Rasmus Cederdorff", "mail": "race@mail.dk", "title": "Senior Lecturer", "img": "https://www.eaaa.dk/media/devlvgj/rasmus-cederdorff.jpg?width=800&height=450"}, {"name": "Dan Okkels Brendstrup", "mail": "dob@mail.dk", "title": "Lecturer", "img": "https://www.eaaa.dk/media/bdojel41/dan-okkels-brendstrup.jpg?width=800&height=450"}, {"name": "Line Skj\u00f8dt", "mail": "lskj@mail.dk", "title": "Senior Lecturer & Internship Coordinator", "img": "https://www.eaaa.dk/media/14qpfeq4/line-skj%C3%B8dt.jpg?width=800&height=450"}, {"name": "Kasper Fischer Topp", "mail": "kato@mail.dk", "title": "Lecturer", "img": "https://www.eaaa.dk/media/lxzcybme/kasper-topp.jpg?width=800&height=450"}, {"name": "Anne Kirketerp", "mail": "anki@mail.dk", "title": "", "img": ""}]
```

The diagram illustrates the data flow in a web application. On the left, a screenshot of a code editor shows the file `app.js` with the following code:

```
1 let persons = [] // global variable
2
3 async function getPerson() {
4     const response = await fetch(
5         "https://raw.githubusercontent.com/cederdorff/web-diplom-frontend/main/_data/persons.json"
6     ); // fetch request - fetch data from a given url
7     persons = await response.json(); // setting global variable with fetched data
8     displayPersons(persons); // calling displayPersons with persons as parameter
9 }
10
11 function displayPersons(listOfPersons) {
12     let html = ""; // variable to store html
13     //loop through all persons and create an article with content for each
14     for (const person of listOfPersons) {
15         html += /*html*/
16             `

17                 
18                 <h2>${person.name}</h2>
19                 <p>${person.title}</p>
20                 <a href="mailto:${person.mail}">${person.mail}</a>
21             </article>
22         `; // generate and save html for every person in html variable
23     }
24     // set grid container content with person <article> elements
25     // saved in html
26     document.querySelector("#content").innerHTML = html;
27 }
28
29 getPerson(); // execute get persons to start the fun
30

```

On the right, a screenshot of a browser window shows the JSON data source at `https://raw.githubusercontent.com/cederdorff/web-diplom-frontend/main/_data/persons.json`. The JSON array contains the following objects:

```
[{"name": "Birgitte Kirk Iversen", "mail": "bki@mail.dk", "title": "Senior Lecturer", "img": "https://www.eaaa.dk/media/u4gorzsd/birgitte-kirk-iversen2.jpg?width=800&height=450"}, {"name": "Martin Aagaard N\u00f8hr", "mail": "mnor@mail.dk", "title": "Lecturer", "img": "https://www.eaaa.dk/media/oayjq02h/martin-n%C3%B8hr.jpg?width=800&height=450"}, {"name": "Rasmus Cederdorff", "mail": "race@mail.dk", "title": "Senior Lecturer", "img": "https://www.eaaa.dk/media/devlvgj/rasmus-cederdorff.jpg?width=800&height=450"}, {"name": "Dan Okkels Brendstrup", "mail": "dob@mail.dk", "title": "Lecturer", "img": "https://www.eaaa.dk/media/bdojel41/dan-okkels-brendstrup.jpg?width=800&height=450"}, {"name": "Line Skj\u00f8dt", "mail": "lskj@mail.dk", "title": "Senior Lecturer & Internship Coordinator", "img": "https://www.eaaa.dk/media/14qpfq4/line-skj%C3%B8dt.jpg?width=800&height=450"}, {"name": "Kasper Fischer Topp", "mail": "kato@mail.dk", "title": "Lecturer", "img": "https://www.eaaa.dk/media/lxzcybme/kasper-topp.jpg?width=800&height=450"}, {"name": "Anne Kirketerp", "mail": "anki@mail.dk", "title": "", "img": ""}]
```

fetch-persons-grid

index.html — web-diplom-frontend

JS app.js

```
fetch-persons-grid > JS app.js > ...
1 let persons = [] // global variable
2
3 async function getPerson() {
4     const response = await fetch(
5         "https://raw.githubusercontent.com/cederdorff/web-diplom-frontend/main/_data/persons.json"
6     ); // fetch request - fetch data from a given url
7     persons = await response.json(); // setting global variable with fetched data
8     displayPersons(persons); // calling displayPersons with persons as parameter
9 }
10
11 function displayPersons(listOfPersons) {
12     let html = ""; // variable to store html
13     //loop through all persons and create an article with content for each
14     for (const person of listOfPersons) {
15         html += /*html*/ `
16             <article>
17                 
18                 <h2>${person.name}</h2>
19                 <p>${person.title}</p>

fetch-persons-grid

Fetch

... get & post data from and to a data source

```
// Simple javascript 😒  
  
//Synchronous fetch using async/await.  
  
// Usual way  
✓ const jsonData = fetch('URL')  
    .then(response => response.json())  
    .then(json => console.log(json));  
  
// Using await  
✓ const jsonData = await fetch('URL').then(res => res.json())  
  
// Shorter syntax 😊  
✓ const jsonData = await (await fetch('URL')).json();
```

<https://www.instagram.com/p/B0nxQjXj9Zi/>

Async JS

JavaScript reads and runs the script from top to bottom.

JavaScript functions are executed in the sequence they are called. Not in the sequence they are defined.

... by default JavaScript is synchronous.

JS is Synchronous & Single-Threaded

```
function myFirst() {  
  console.log("Hello");  
}
```

```
function mySecond() {  
  console.log("Goodbye");  
}
```

```
mySecond();  
myFirst();
```

```
/* ----- Global Variables ----- */
let _users = [];
let _selectedUserId;

/* ----- */

async function fetchUsers() { ... }
function appendUsers(usersArray) { ... }
}

// ===== INIT APP =====

async function initApp() {
    await fetchUsers();
    appendUsers(_users);
}

initApp();
```

With callbacks, we can make JS Asynchronous

```
setTimeout(() => {
  console.log("Hey, I'm async!");
}, 3000);

btn.addEventListener('click', () => {
  alert("Hey, you clicked me!");
});
```

```
// fetch with callbacks
fetch("https://cederdorff.github.io/web-frontend/canvas")
  .then(function (response) {
    return response.json();
  })
  .then(function (data) {
    console.log(data);
  });
});
```

Fetch is Asynchronous

And it's about making HTTP requests in JavaScript.
... and a way to get & post data from and to a data source.

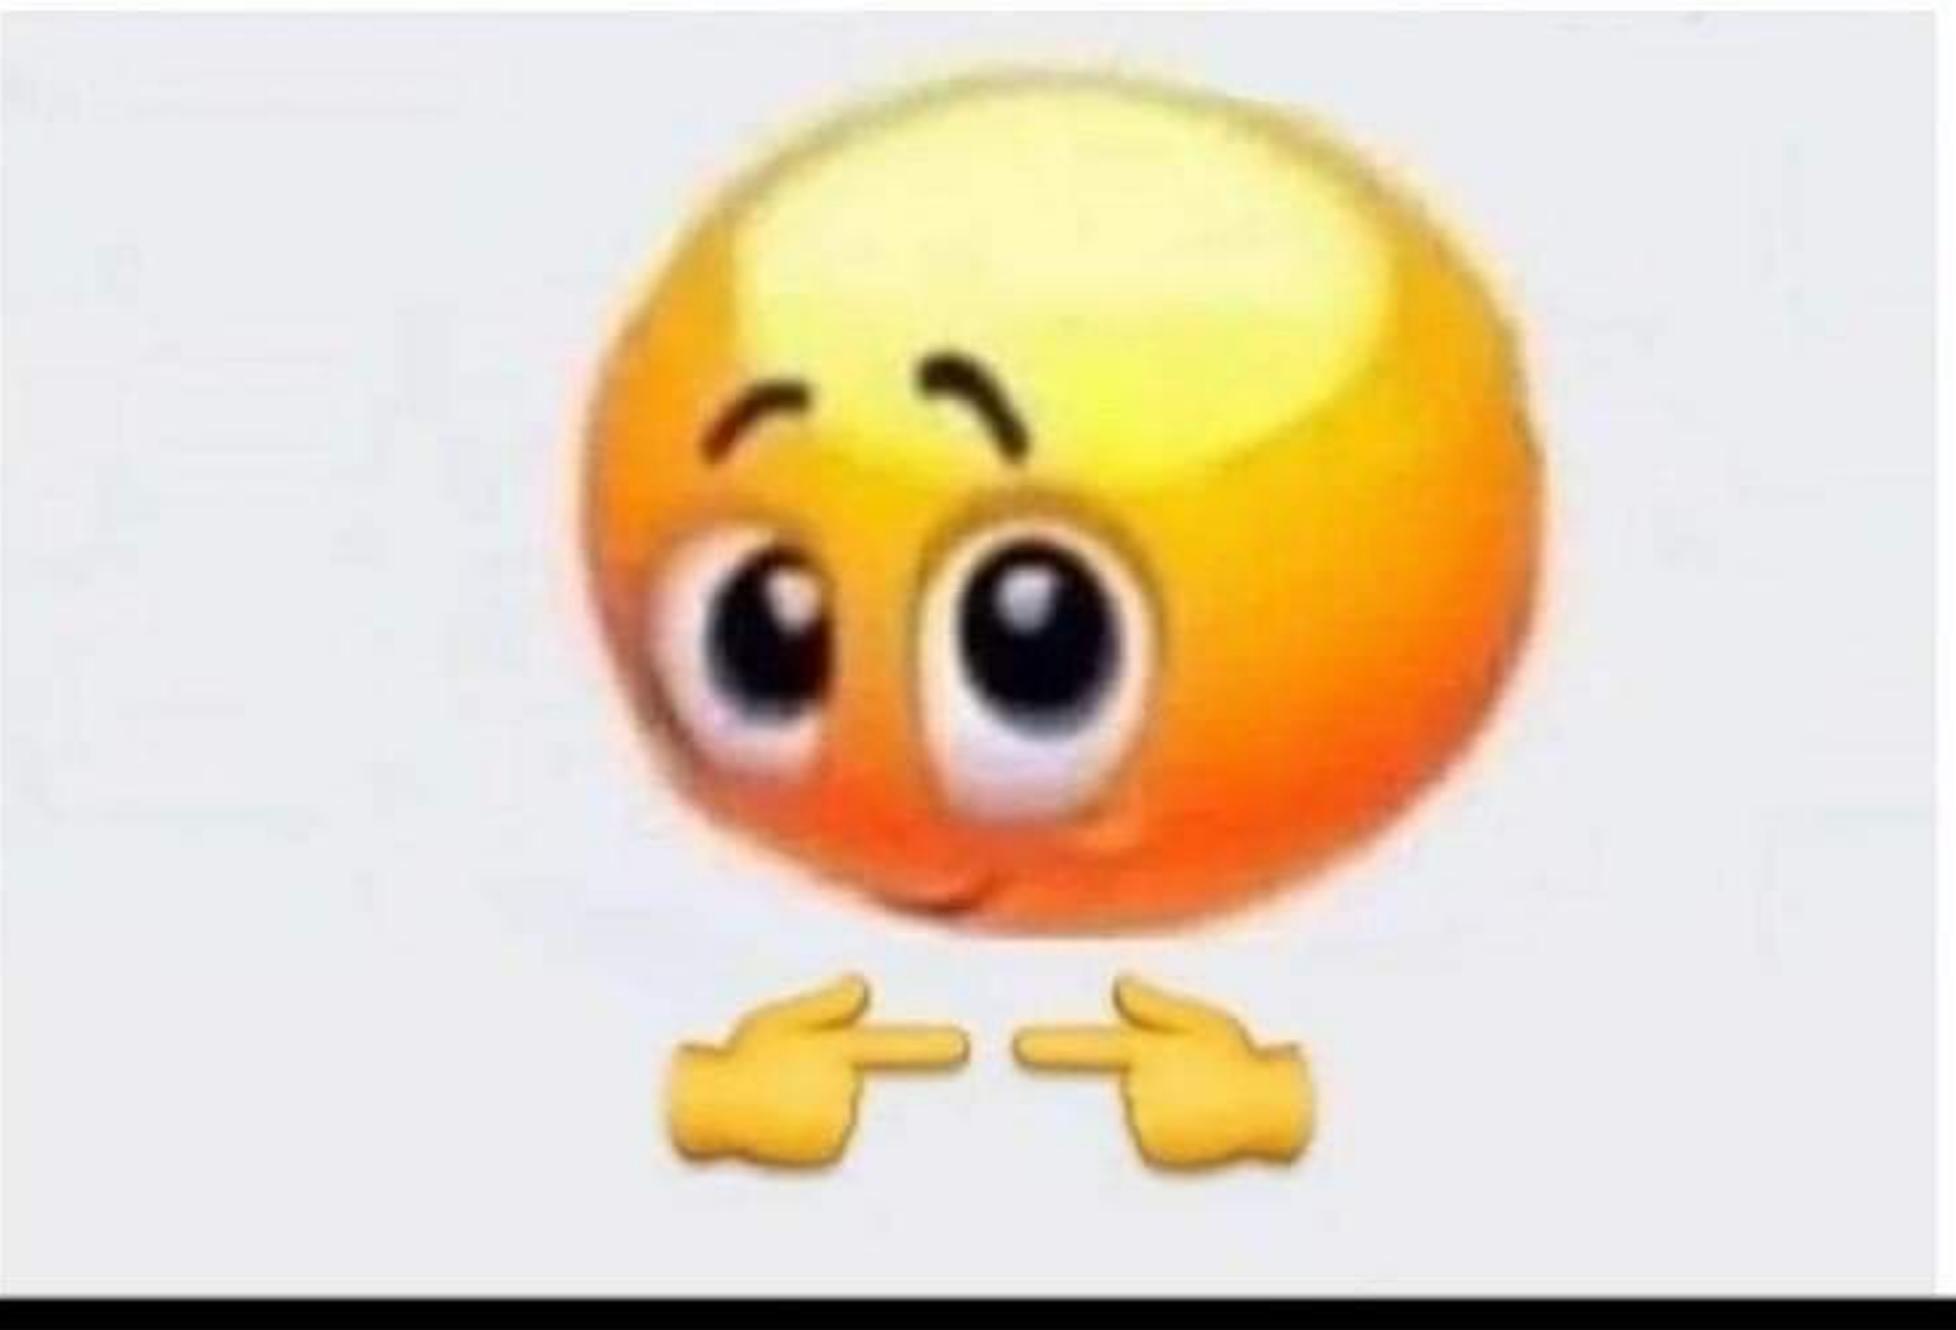

```
// fetch with callbacks
fetch("https://cederdorff.github.io/web-frontend/canvas-users/data.json")
  .then(function (response) {
    return response.json();
  })
  .then(function (data) {
    console.log(data);
  });

```

Fetch: callback (then) vs async/await

```
// fetch with callbacks
fetch("https://cederdorff.github.io/web-frontend/canvas-users/data.json")
  .then(function (response) {
    return response.json();
  })
  .then(function (data) {
    console.log(data);
  });
// 
// 
// or with async/await
const response = await fetch("https://cederdorff.github.io/web-frontend/canvas-users/data.json");
const data = await response.json();
console.log(data);
```

will you be async to my await?

async & await

- Use await to tell JS to wait for a fetch call to finish and to wait for JSON to parse.
- When using await you must tell JS that inside of the function goes some asynchronous code by wrapping it in an async function.

```
async function getPosts() {  
  const url = "https://raw.githubusercontent.com/.../data.json";  
  const response = await fetch(url);  
  const data = await response.json();  
  setPosts(data);  
}  
  
getPosts();
```

**"async and await makes promises
easier to write"**

async makes a function return a Promise

await makes a function wait for a Promise

https://www.w3schools.com/js/js_async.asp

Fetch returns a promise

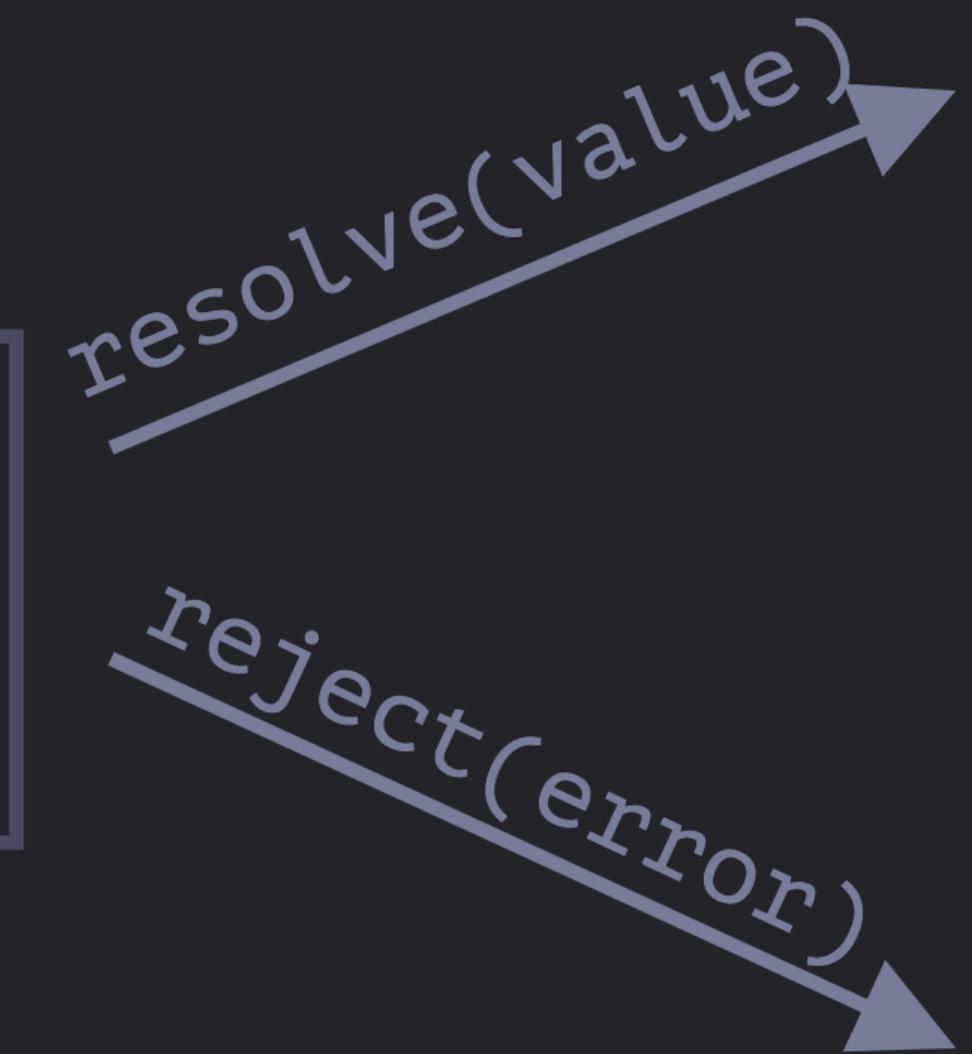

We can use `await` to wait for `fetch` to finish

https://www.w3schools.com/js/js_async.asp

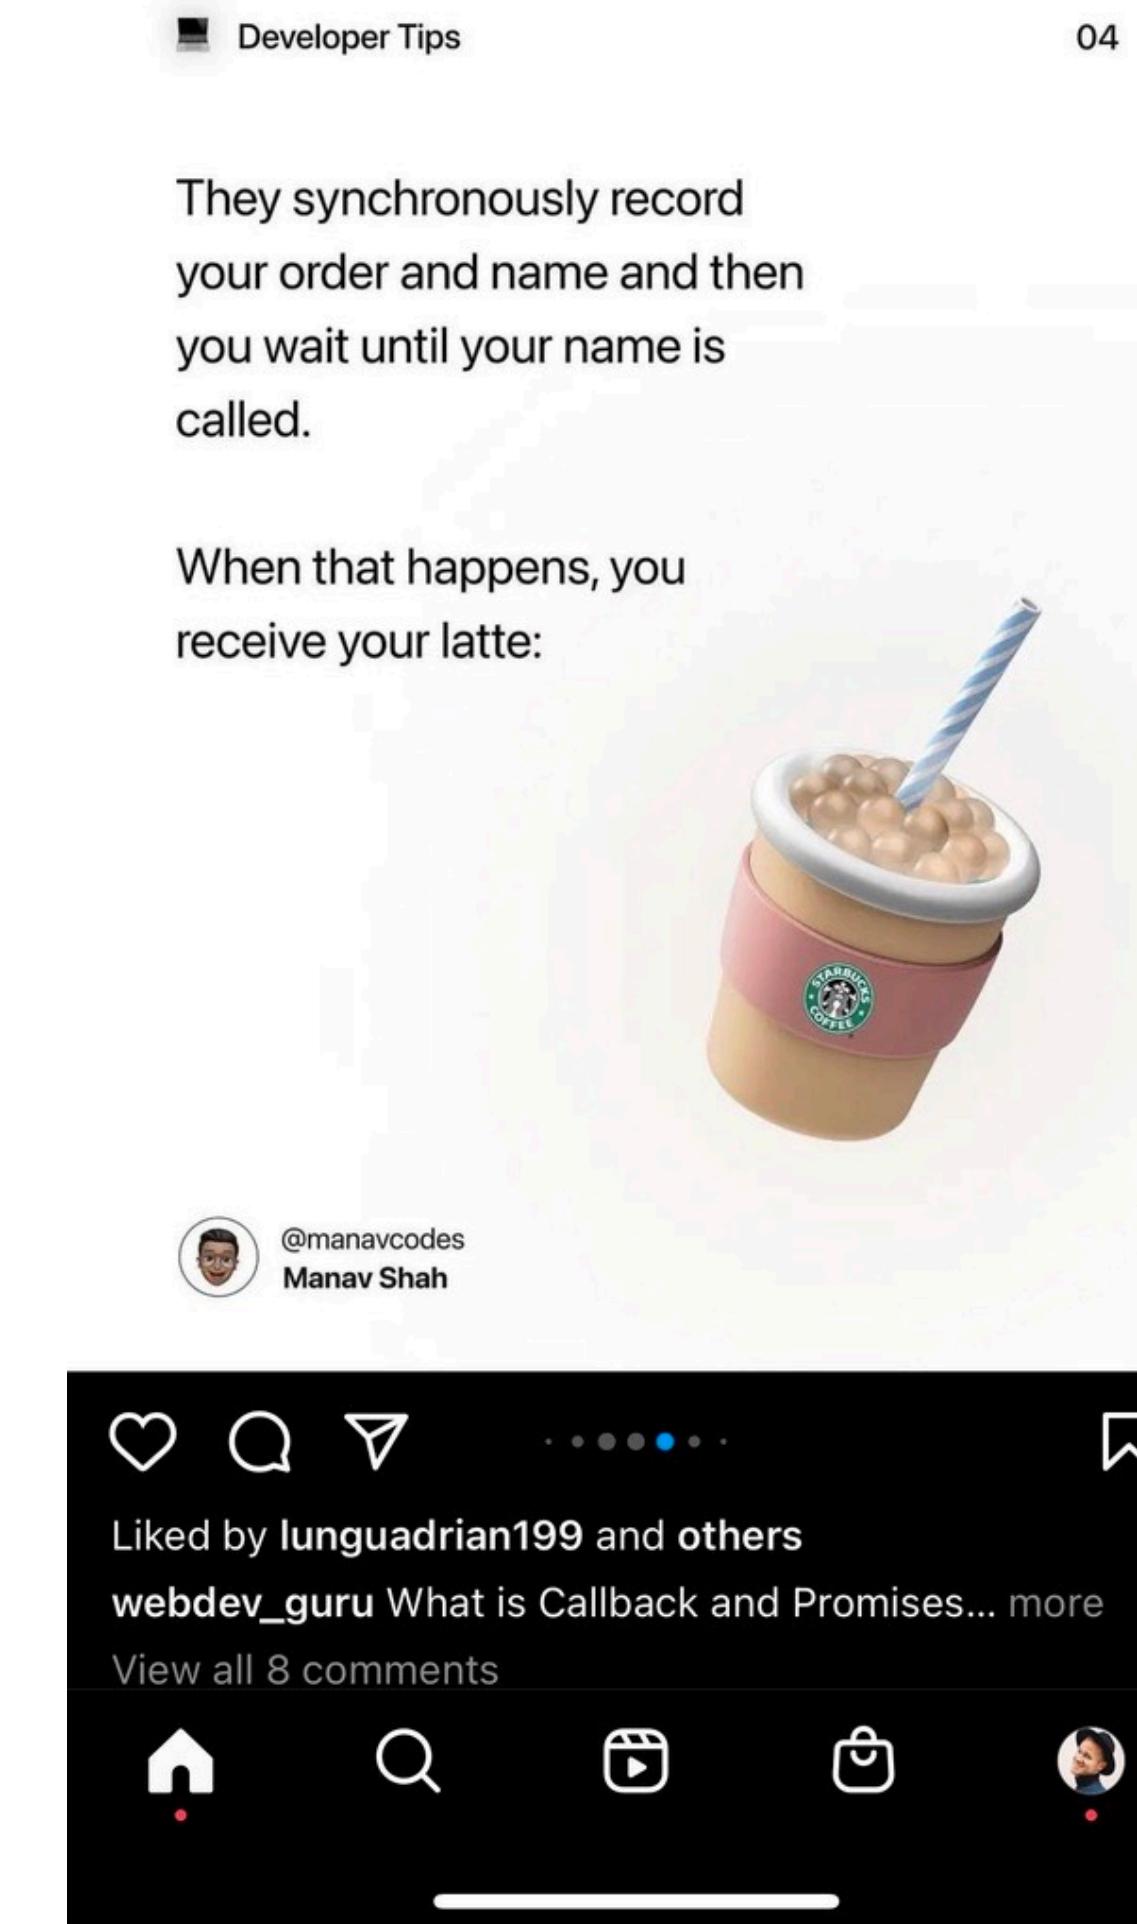

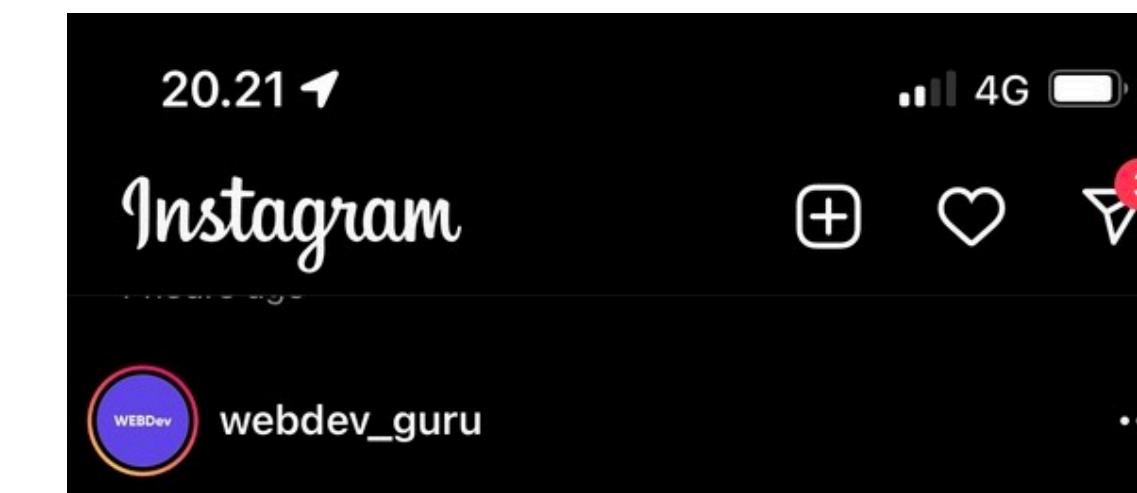

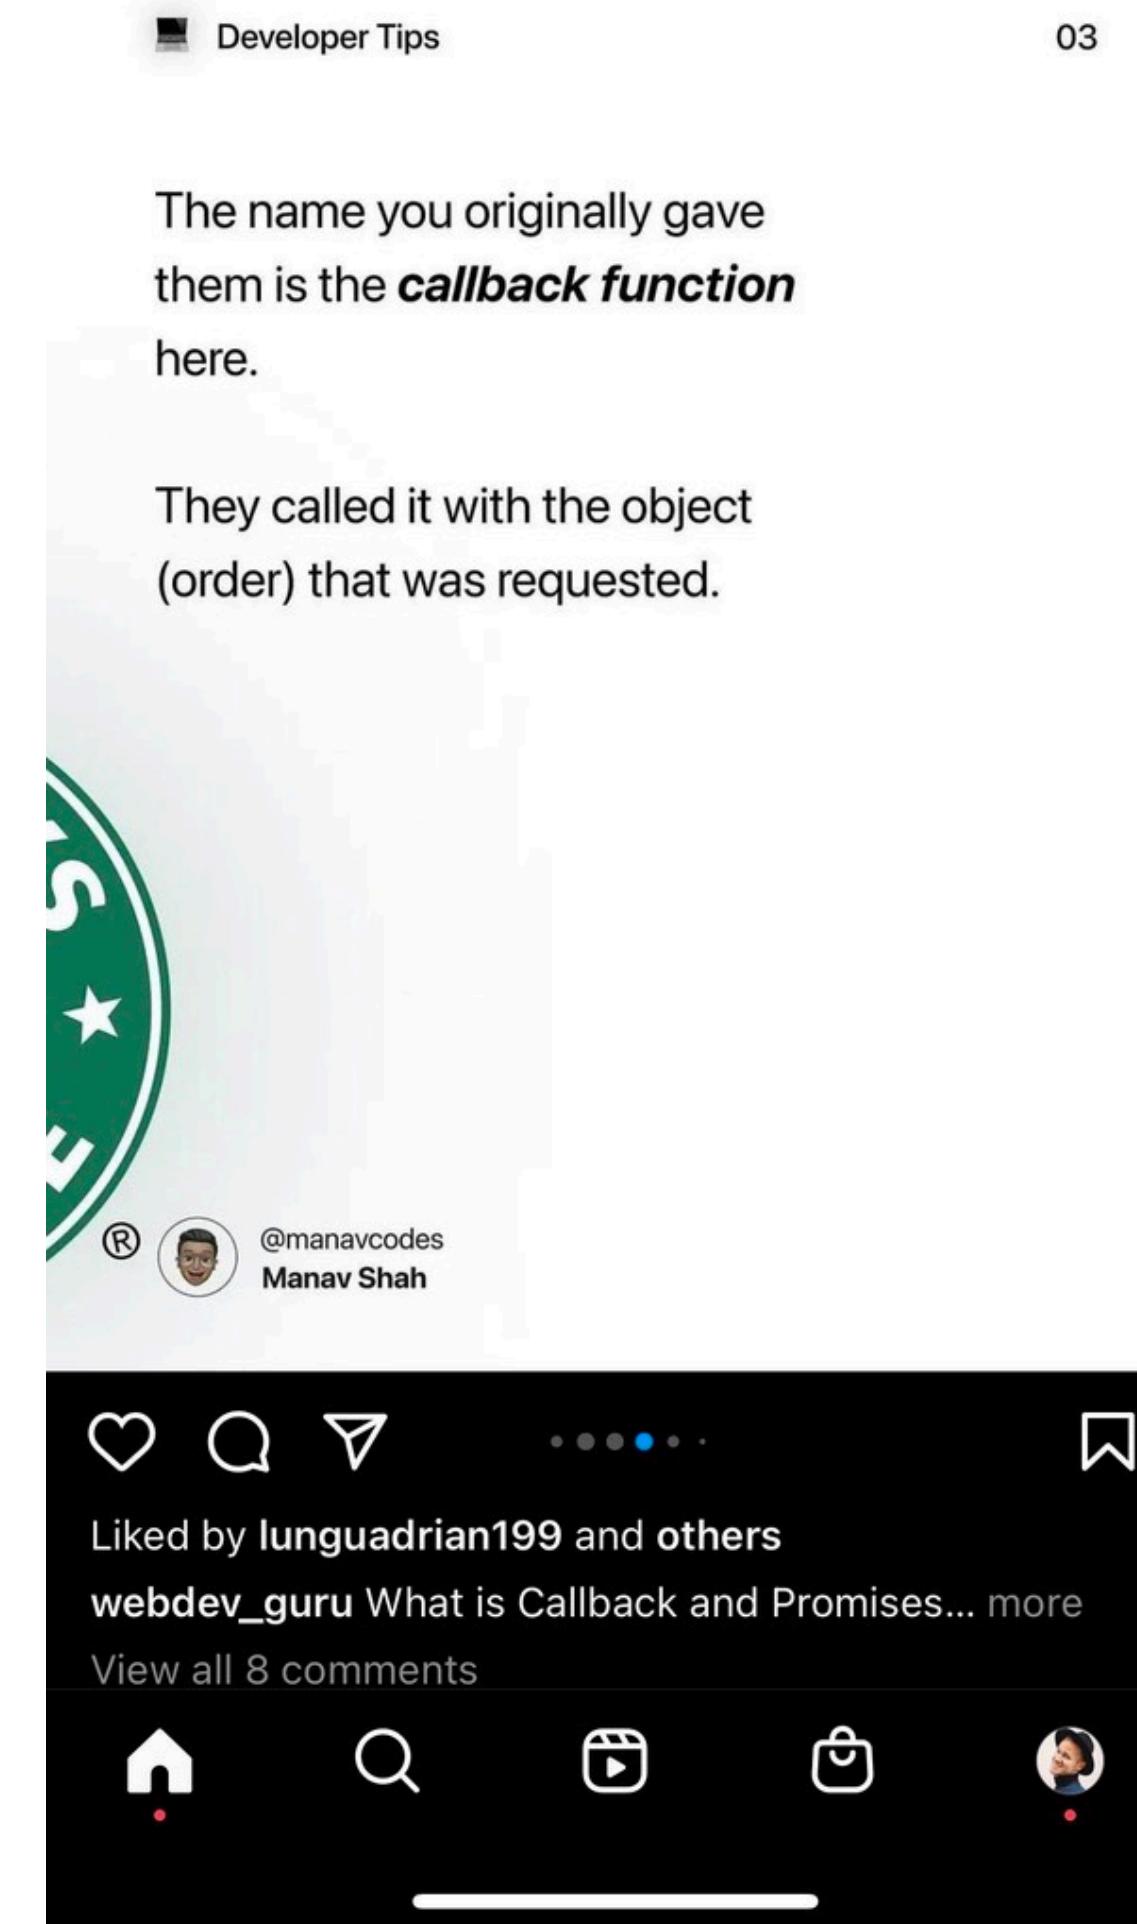

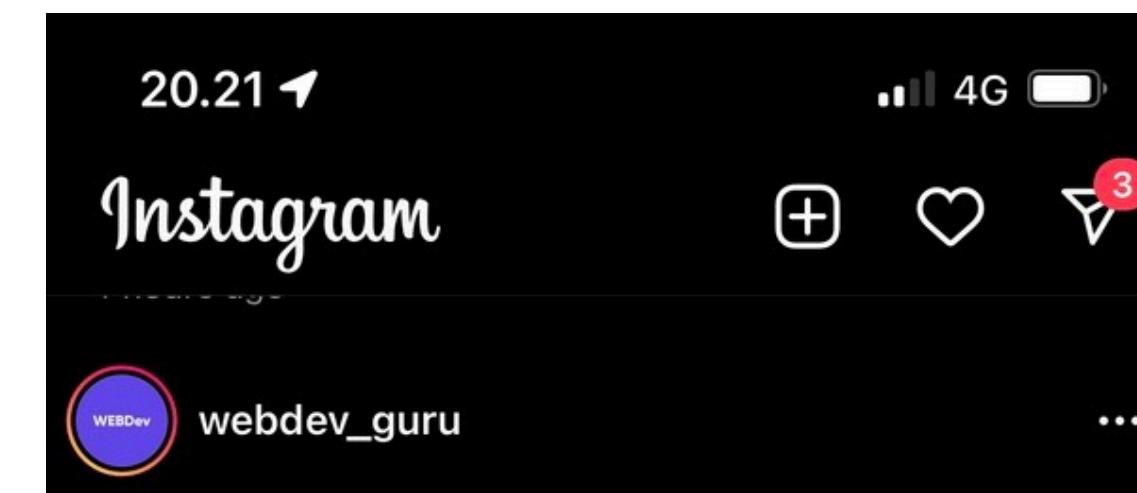

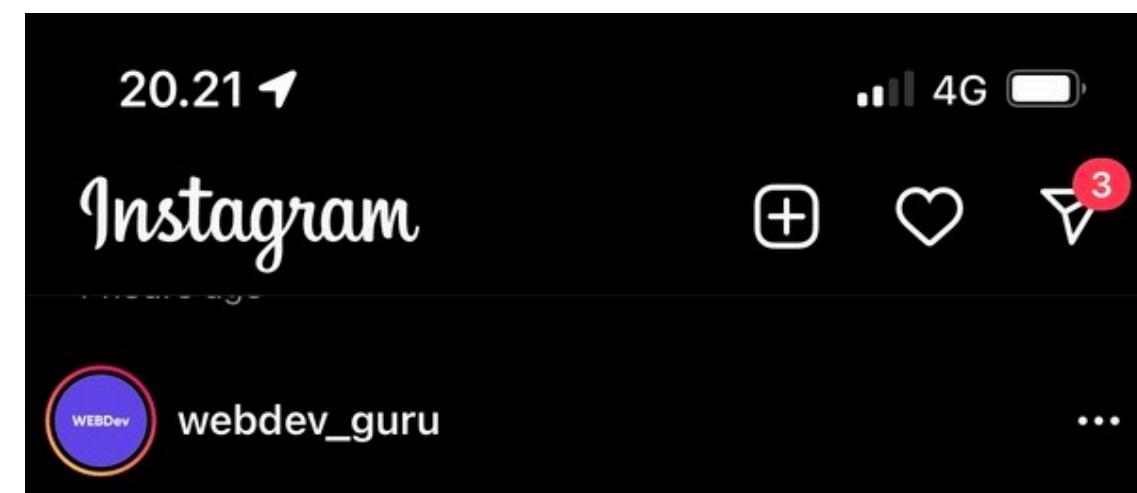

```
new Promise(executor)
```

state: "pending"
result: undefined

state: "fulfilled"
result: value

state: "rejected"
result: error

```
let myPromise = new Promise(function (resolve, reject) {
    // "Producing Code" (May take some time)
    // Making coffee ...
    resolve("Yaaay, here's your coffee"); // when successful
    reject("Ohh, f***. Something went wrong"); // when error
});

// "Consuming Code" (Must wait for a fulfilled Promise)
myPromise.then(
    function (value) {
        /* code if successful */
        console.log(value); // Yaaay, here's your coffee
    },
    function (error) {
        /* code if some error */
        console.log(error); // Ohh, f***. Something went wrong
    }
);
```

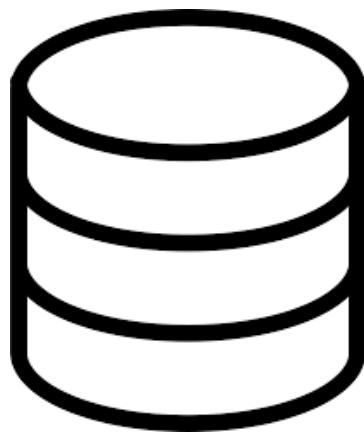

All you need to know

- Use await to tell JS to wait for a fetch call to finish.
- When using await you must tell JS that here goes some asynchronous code by wrapping it in an async function.

```
async function getPosts() {  
  const url = "https://raw.githubusercontent.com/  
  const response = await fetch(url);  
  const data = await response.json();  
  setPosts(data);  
}  
getPosts();
```

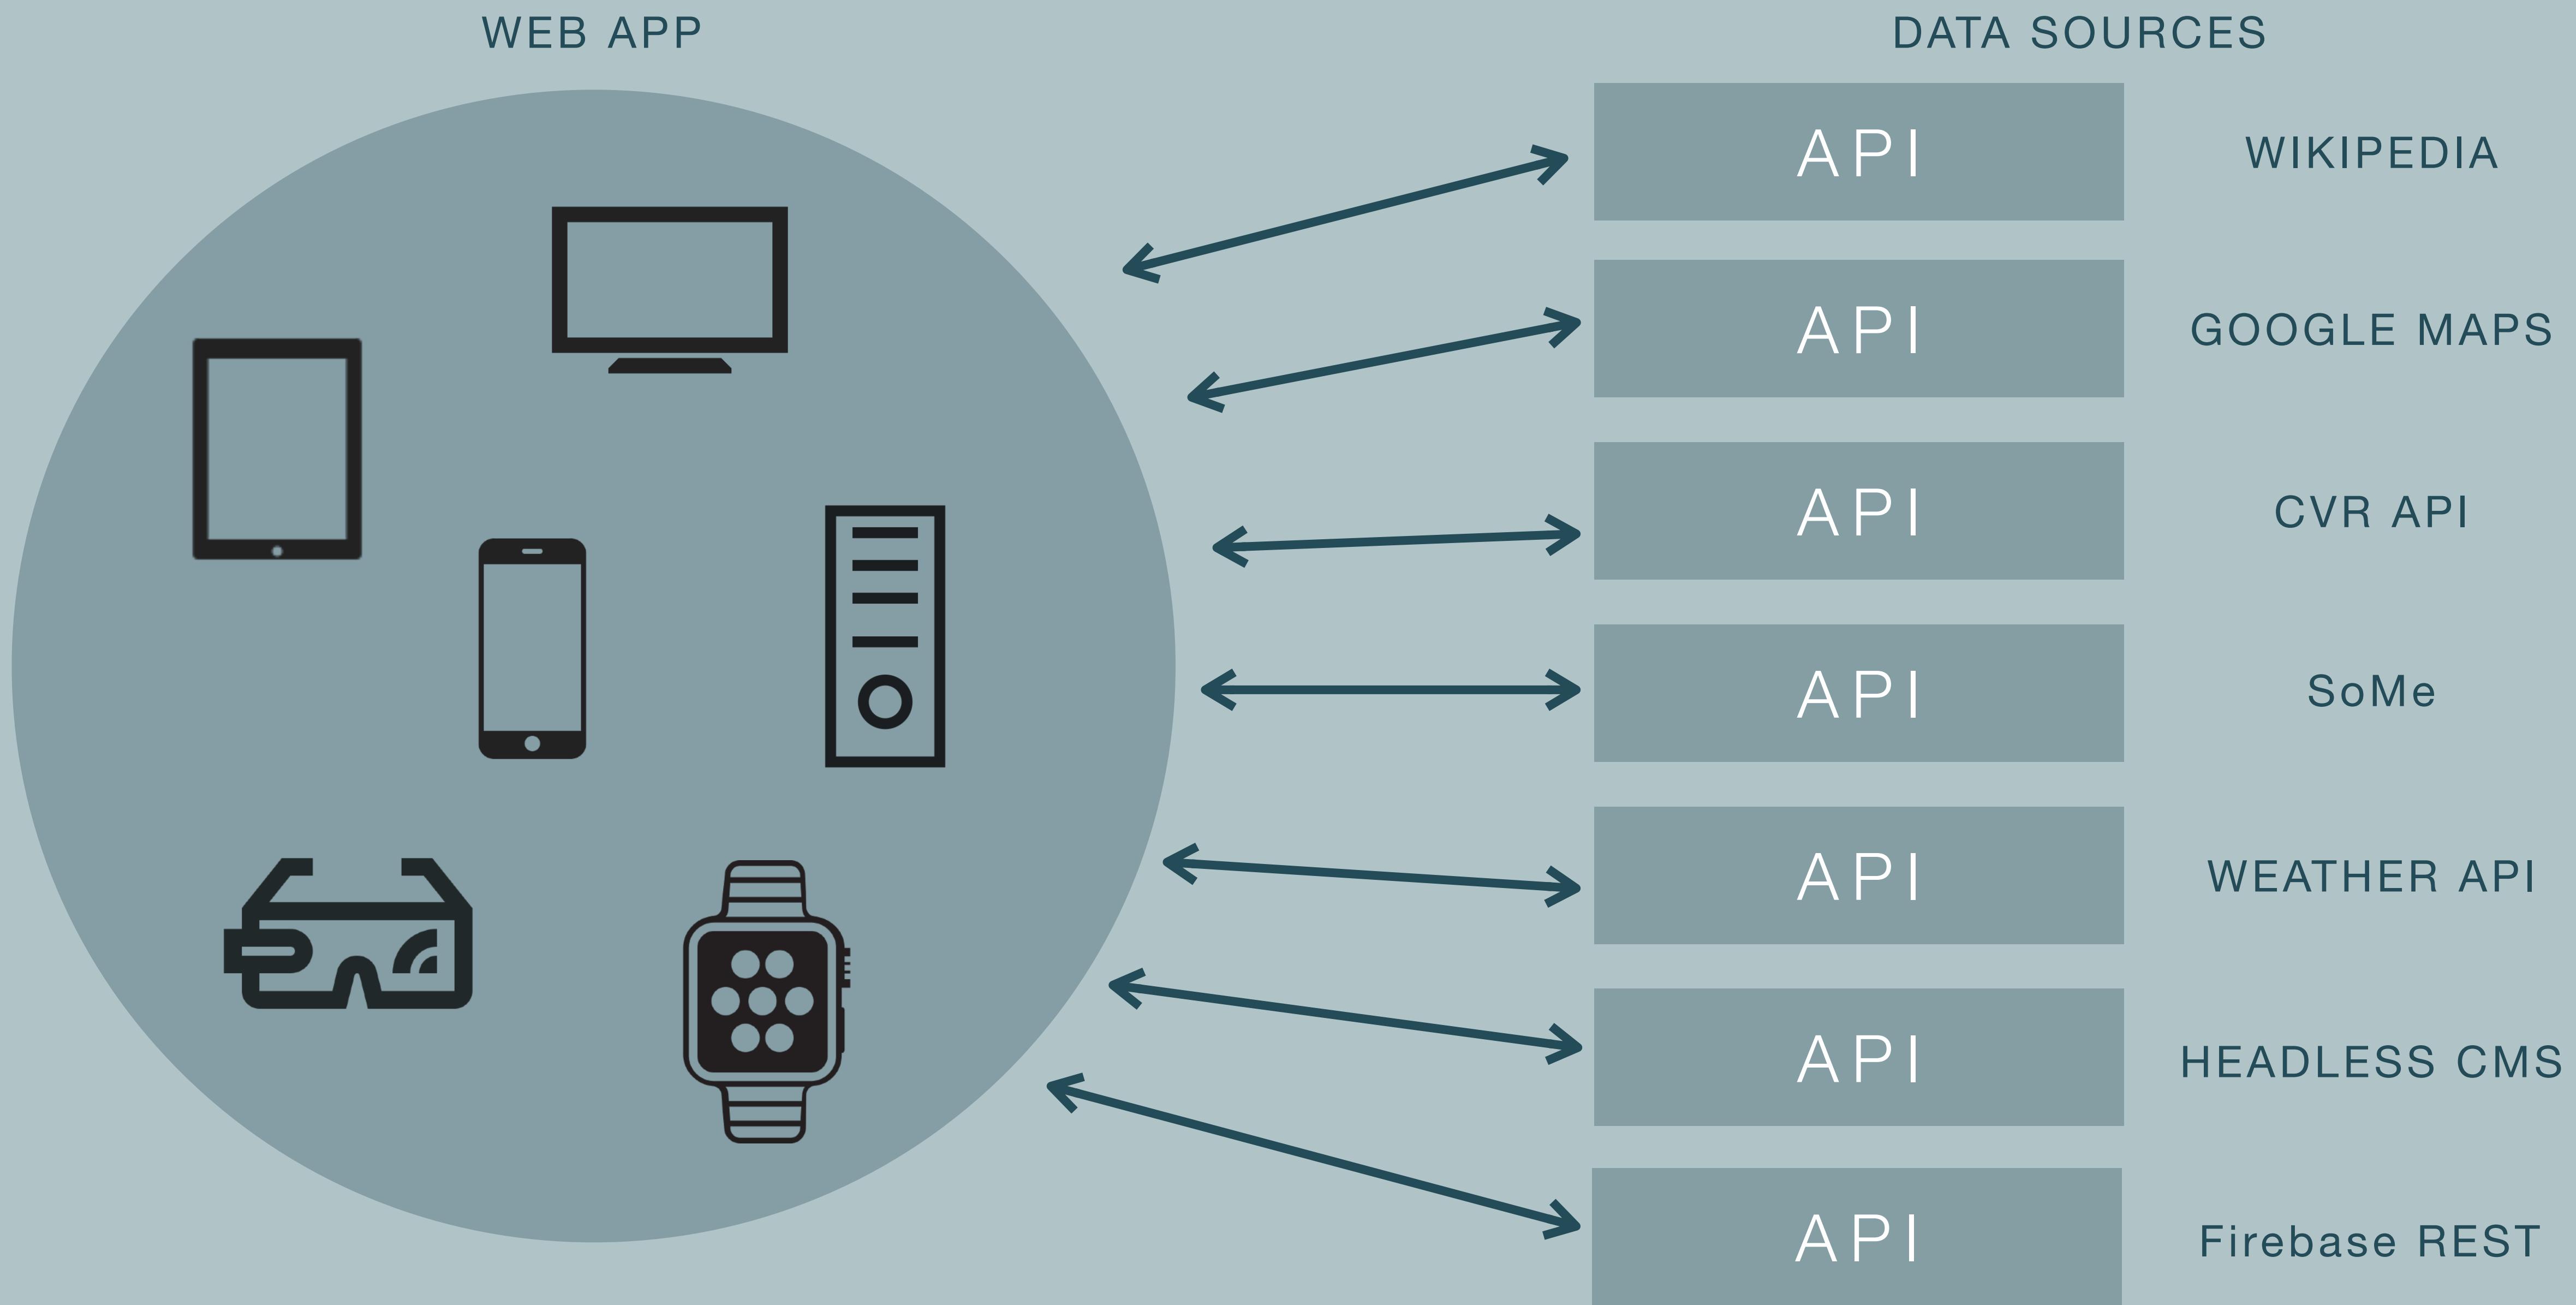

What's a Data Source?

- Location of data
- Where data is coming from
- Can be any kind of data of any file format
- Database, a file, data sheet, spreadsheet, XML, JSON

{JSON}

API

API

Application Programming Interface

A way for two systems to communicate - get and post data.

What's an API?

<https://www.youtube.com/watch?v=s7wmiS2mSXY>

API

APPLICATION PROGRAMMING INTERFACE

The screenshot shows a web browser window titled "API'er - definition og funktion." with the URL "chat.openai.com". The page content is a conversation with AI, starting with a user question "Hvad er en API?" followed by AI responses explaining what APIs are, their functions, and types.

Hvad er en API?

API står for "Application Programming Interface", på dansk "Programmeringsgrænseflade". En API er en samling af software-komponenter, protokoller og værktøjer, der gør det muligt for forskellige programmer eller systemer at kommunikere med hinanden og udveksle data på en standardiseret måde.

API'er kan fungere som en bro mellem forskellige applikationer, platforme eller tjenester, hvilket gør det muligt for udviklere at udnytte funktionalitet eller data fra andre systemer uden at skulle skrive alt koden fra bunden. API'er gør det også muligt at integrere forskellige tjenester og applikationer for at skabe mere komplekse og avancerede systemer.

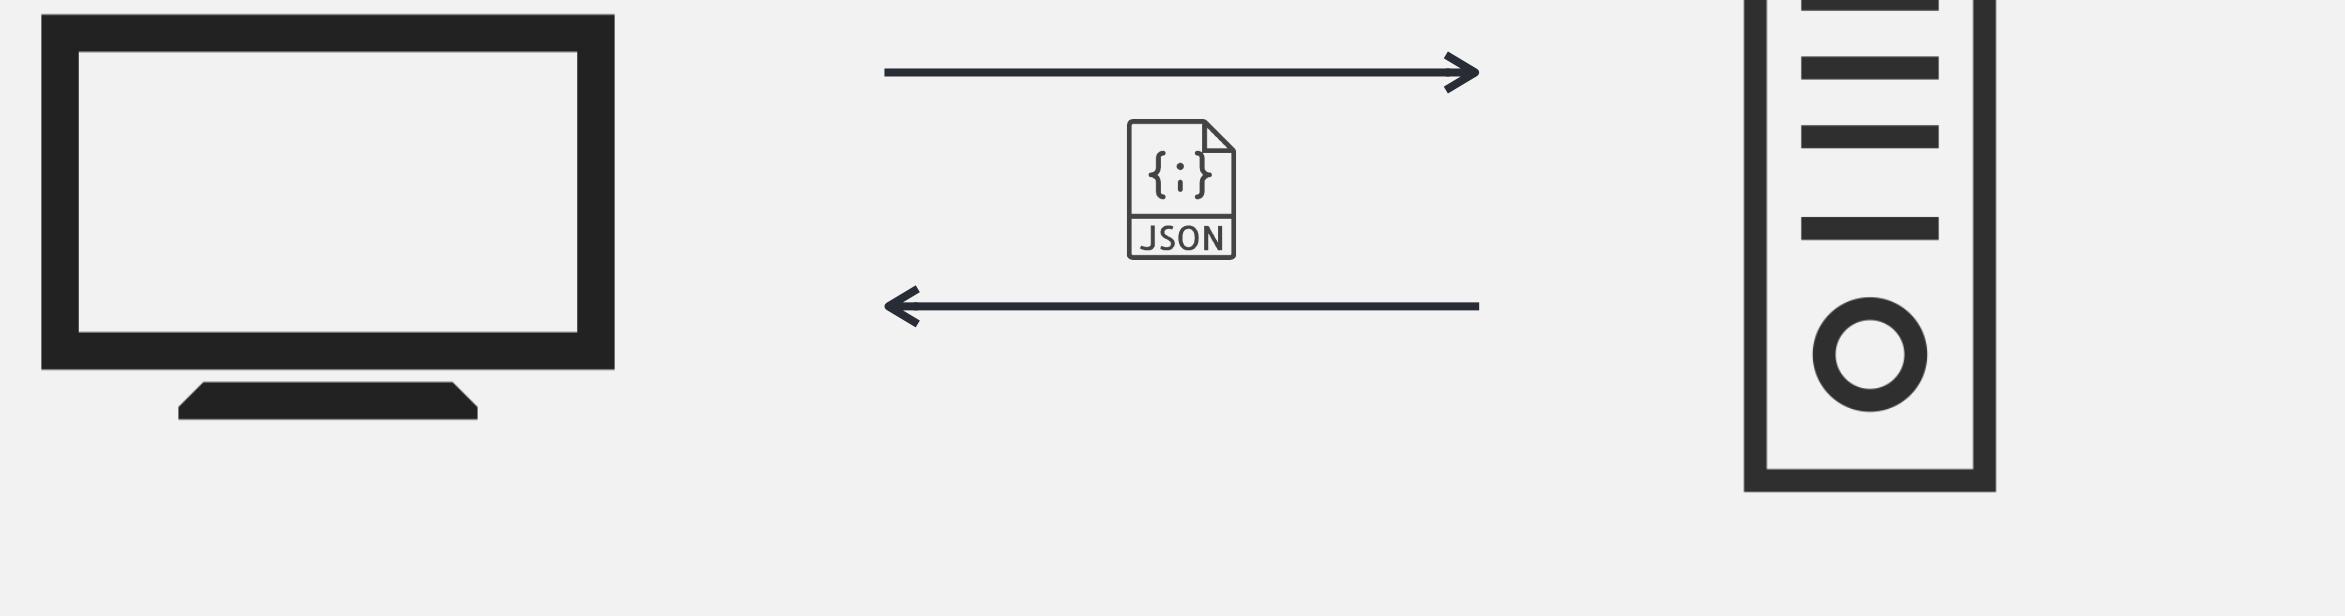

Der findes mange forskellige typer af API'er, inklusiv web-API'er, biblioteks-API'er og operativsystem-API'er. Web-API'er er en af de mest almindelige typer, og disse gør det muligt for applikationer at kommunikere via internettet ved hjælp af standardiserede protokoller såsom HTTP eller REST.

Application Programming Interface

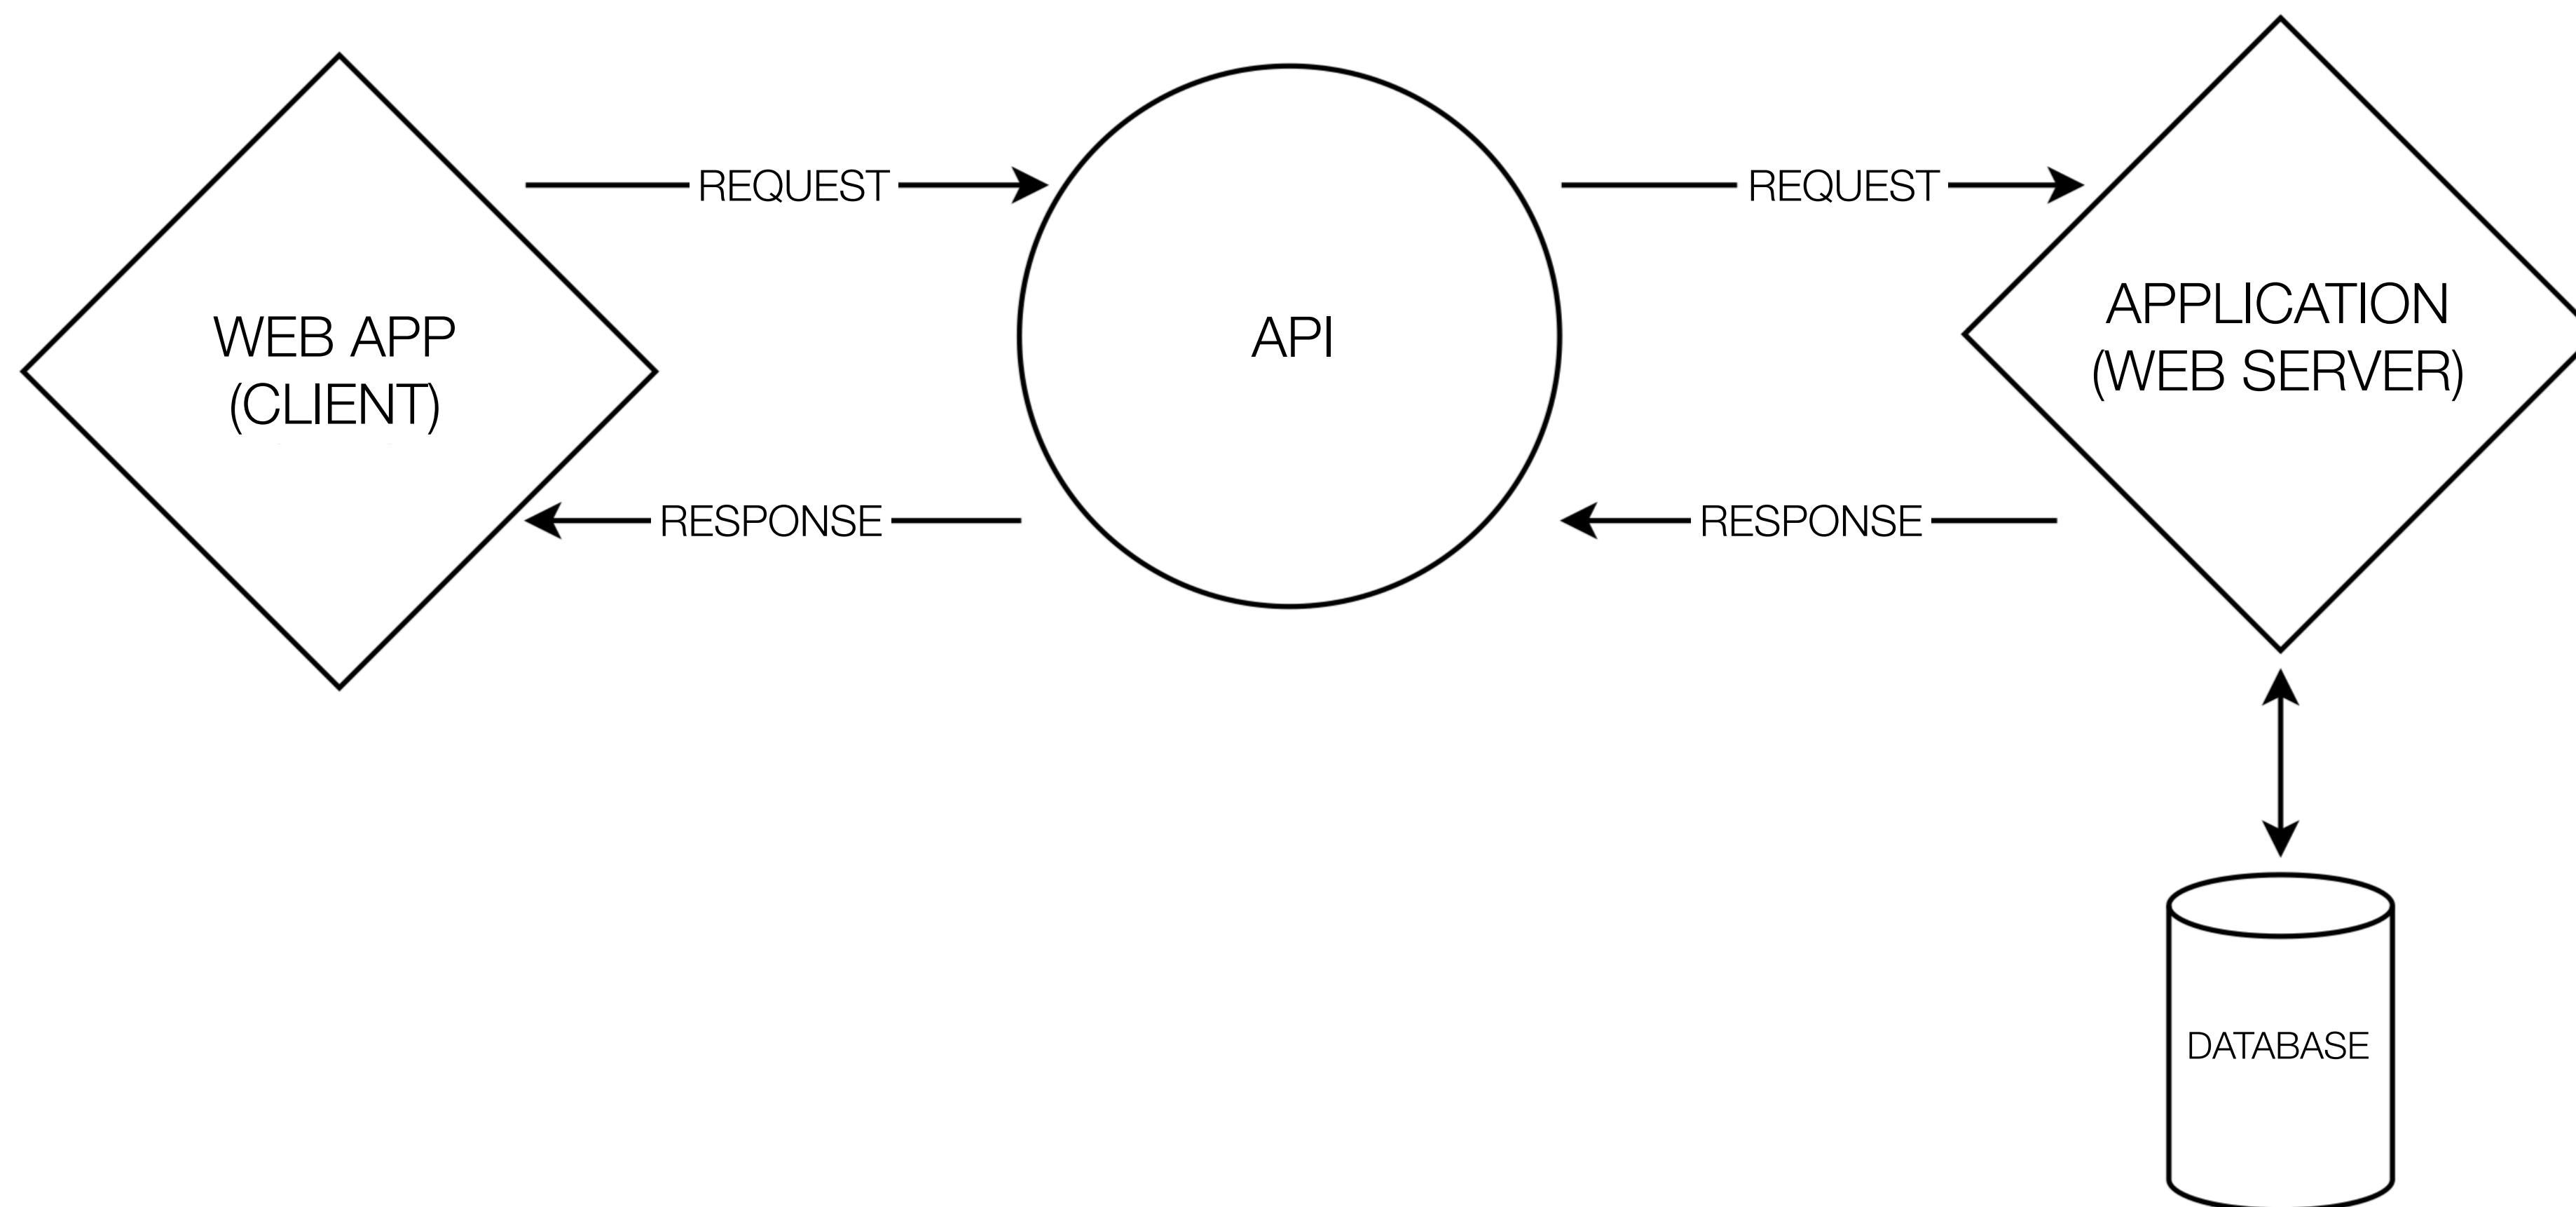

- An interface that makes it possible for two systems to communicate and exchange data in a standardised way.
- Ex communication between a web app and a web server.
- An API is the glue or bridge between different applications, platforms, or services.
- Platform independent: Can be used by different clients, devices and users: websites, web apps, mobile apps, webshops and other clients.
- The client does not need to know anything about the service or program provided by the API and vice versa.
- There are many different types of API's: web APIs, library APIs, operating system APIs, etc.
- Web APIs are one of the most common types, allowing applications to communicate over the web using standardised protocols such as HTTP or REST.

JSON

... a syntax for storing and exchanging data over the web

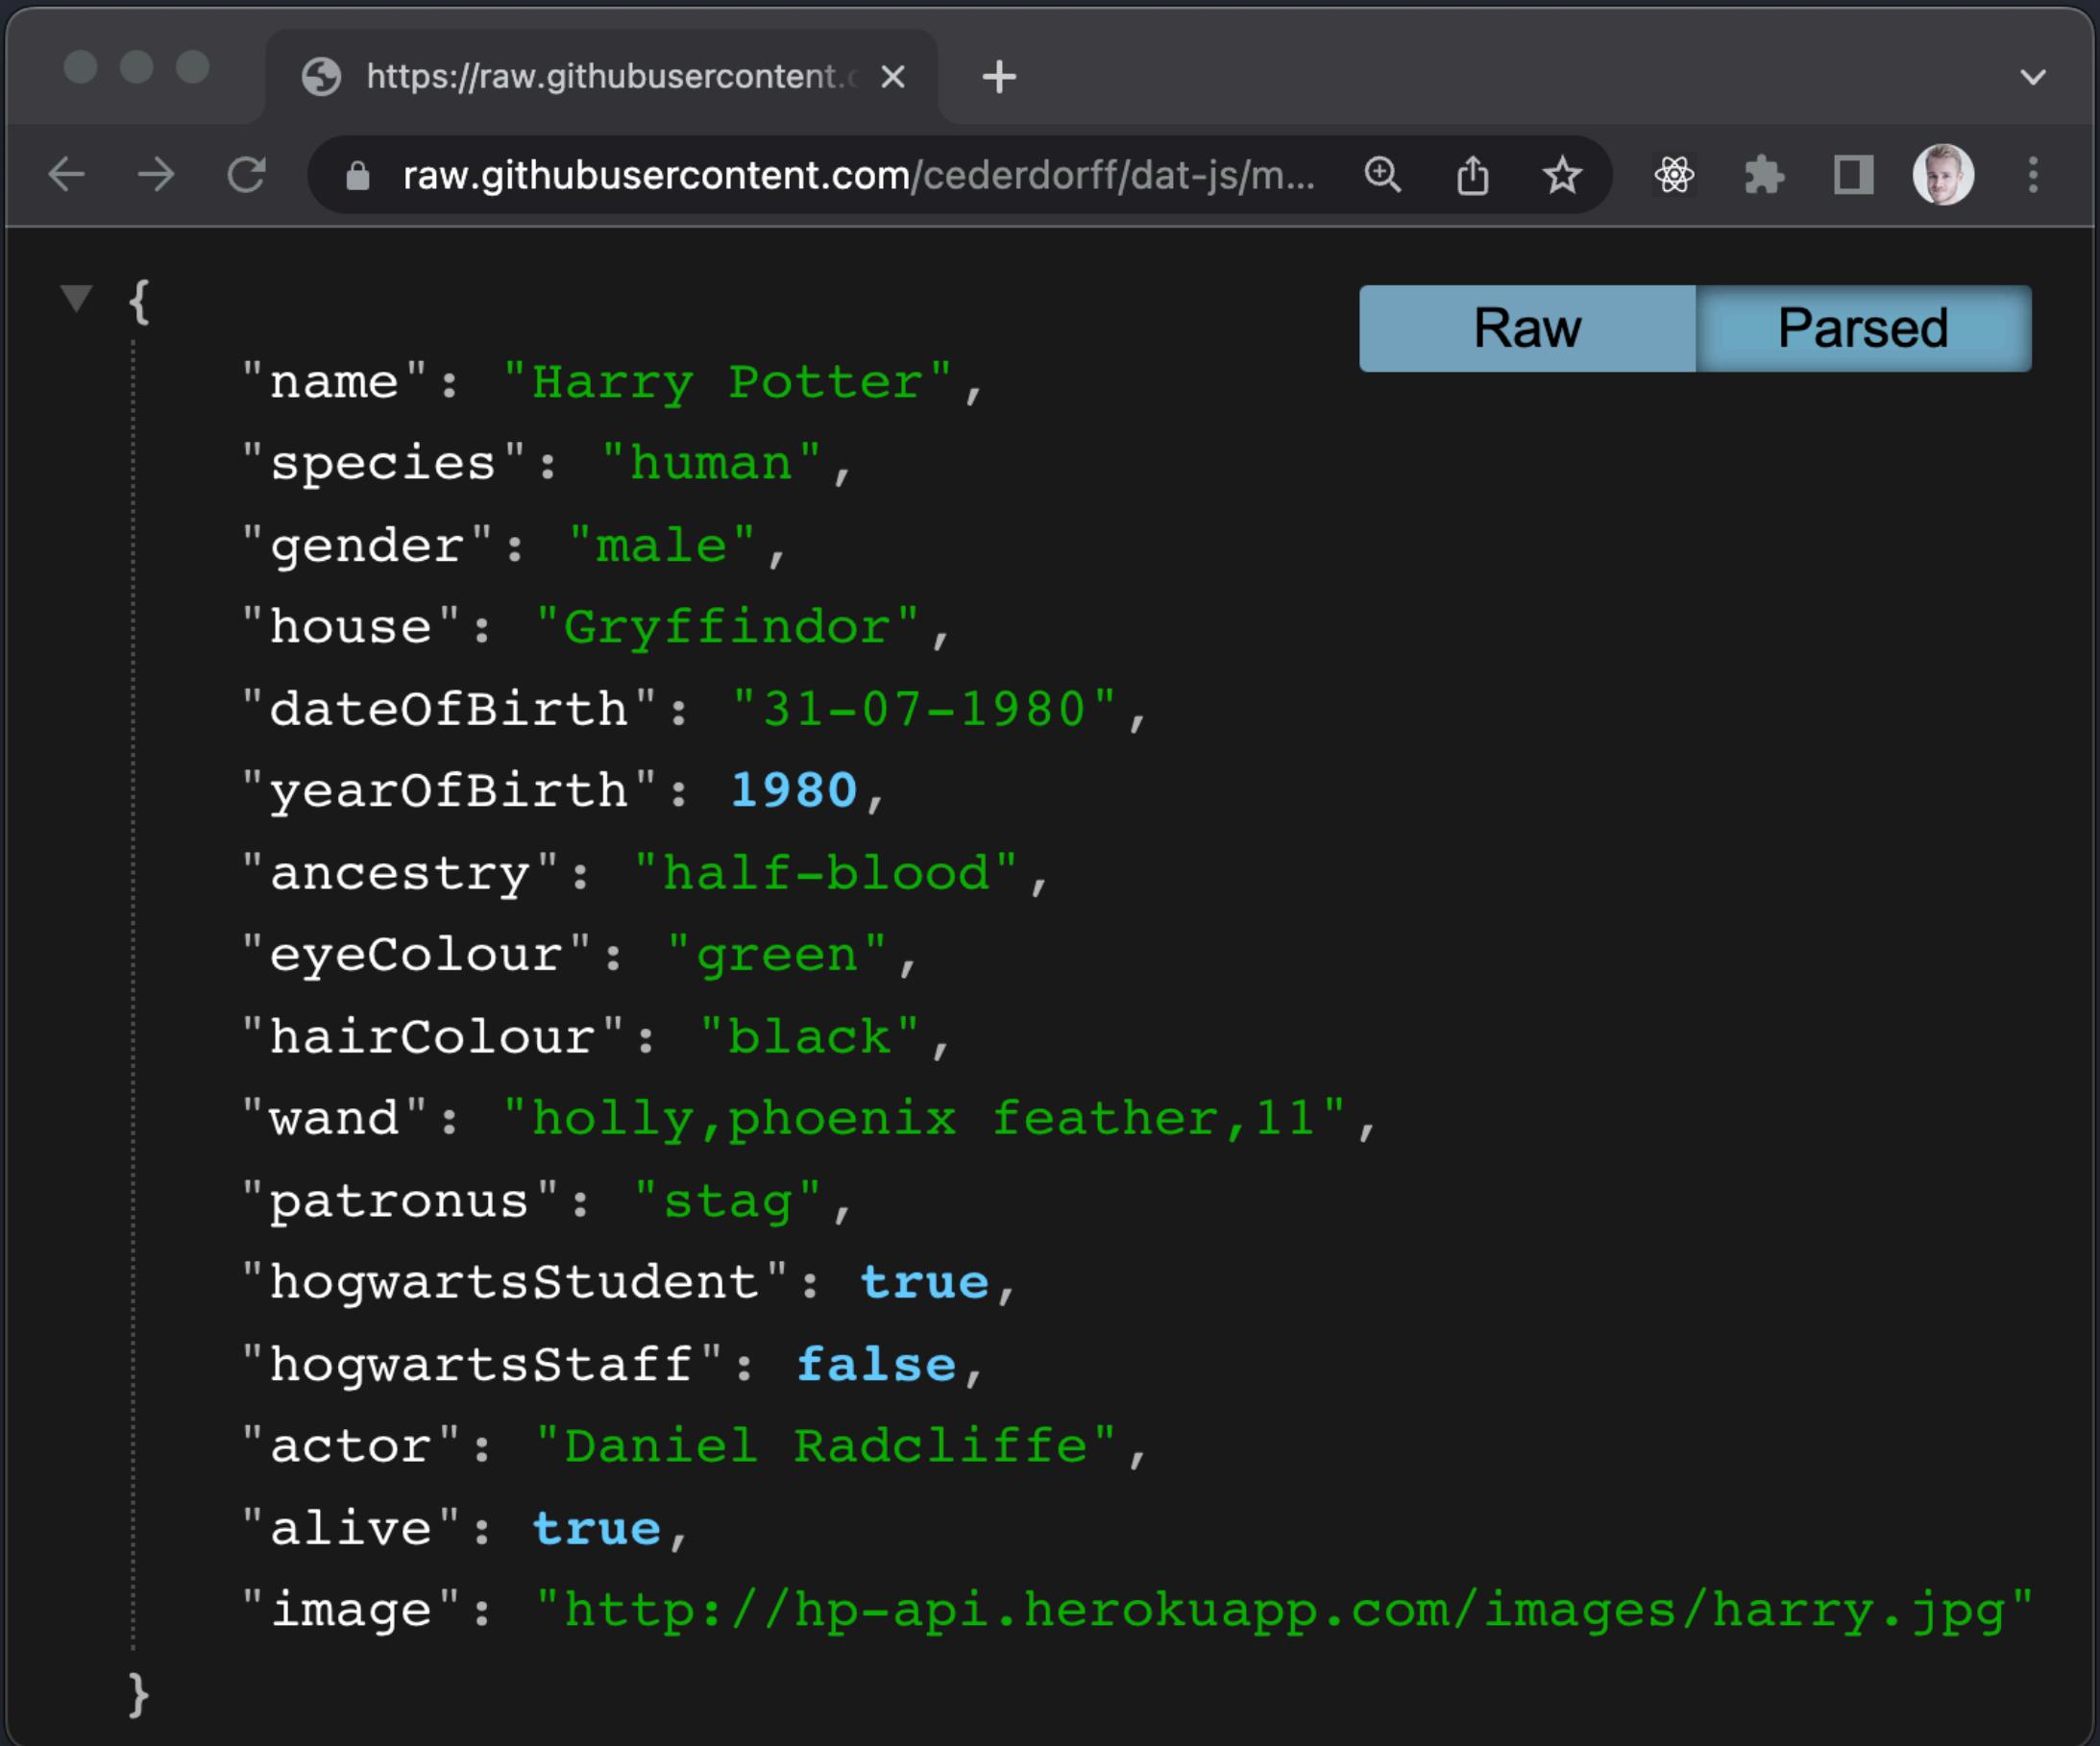

```
{  
  "name": "Alicia",  
  "age": 6  
}
```

JSON OBJECT

```
[{  
  "name": "Alicia",  
  "age": 6  
, {  
  "name": "Peter",  
  "age": 22  
}]
```

LIST OF JSON OBJECTS

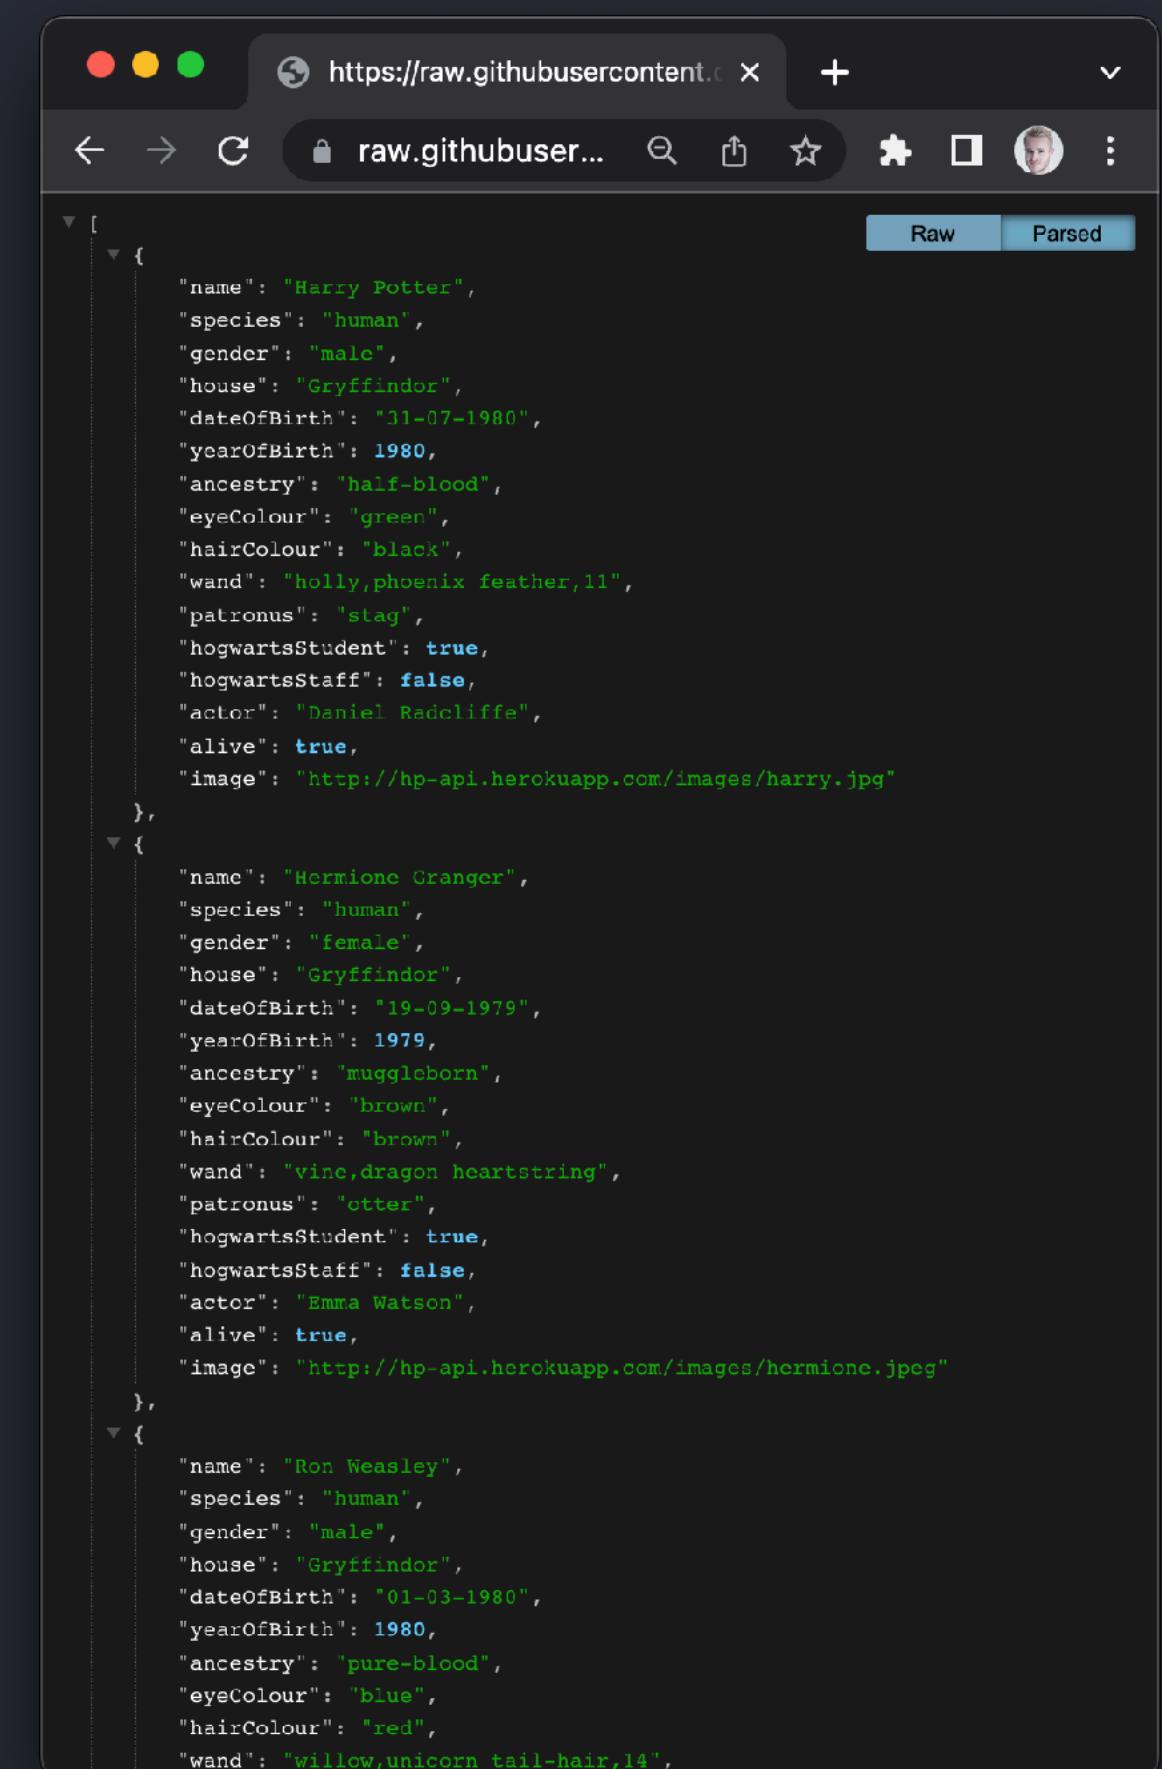

JSON

A screenshot of a web browser window displaying a single JSON object. The URL is <https://raw.githubusercontent.com/cederdorff/dat-js/master/data/harry.json>. The JSON object represents Harry Potter's character details. The 'Raw' tab is selected, showing the raw JSON code, while the 'Parsed' tab shows the same data as an expandable tree structure.

```
{  
  "name": "Harry Potter",  
  "species": "human",  
  "gender": "male",  
  "house": "Gryffindor",  
  "dateOfBirth": "31-07-1980",  
  "yearOfBirth": 1980,  
  "ancestry": "half-blood",  
  "eyeColour": "green",  
  "hairColour": "black",  
  "wand": "holly, phoenix feather, 11",  
  "patronus": "stag",  
  "hogwartsStudent": true,  
  "hogwartsStaff": false,  
  "actor": "Daniel Radcliffe",  
  "alive": true,  
  "image": "http://hp-api.herokuapp.com/images/harry.jpg"  
}
```

JSON OBJECT

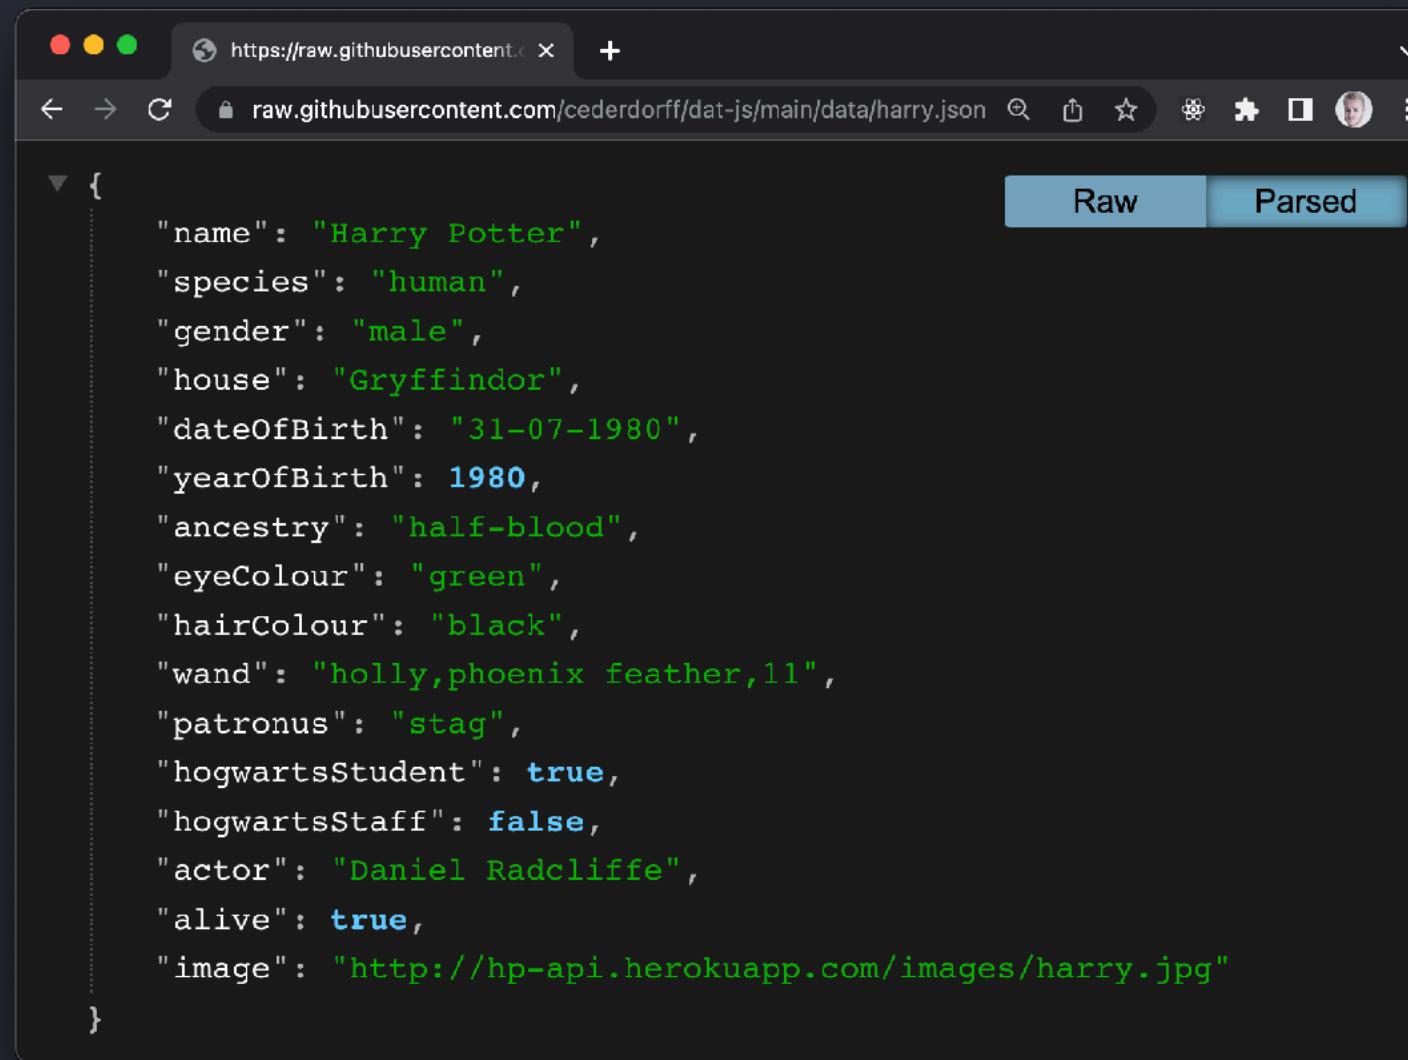

A screenshot of a web browser window displaying a list of three JSON objects. The URL is <https://raw.githubusercontent.com/cederdorff/dat-js/master/data/characters.json>. The JSON array contains three objects: Harry Potter, Hermione Granger, and Ron Weasley. The 'Raw' tab is selected, showing the raw JSON code, while the 'Parsed' tab shows the data as an expandable tree structure.

```
[  
  {  
    "name": "Harry Potter",  
    "species": "human",  
    "gender": "male",  

```

LIST OF JSON OBJECTS

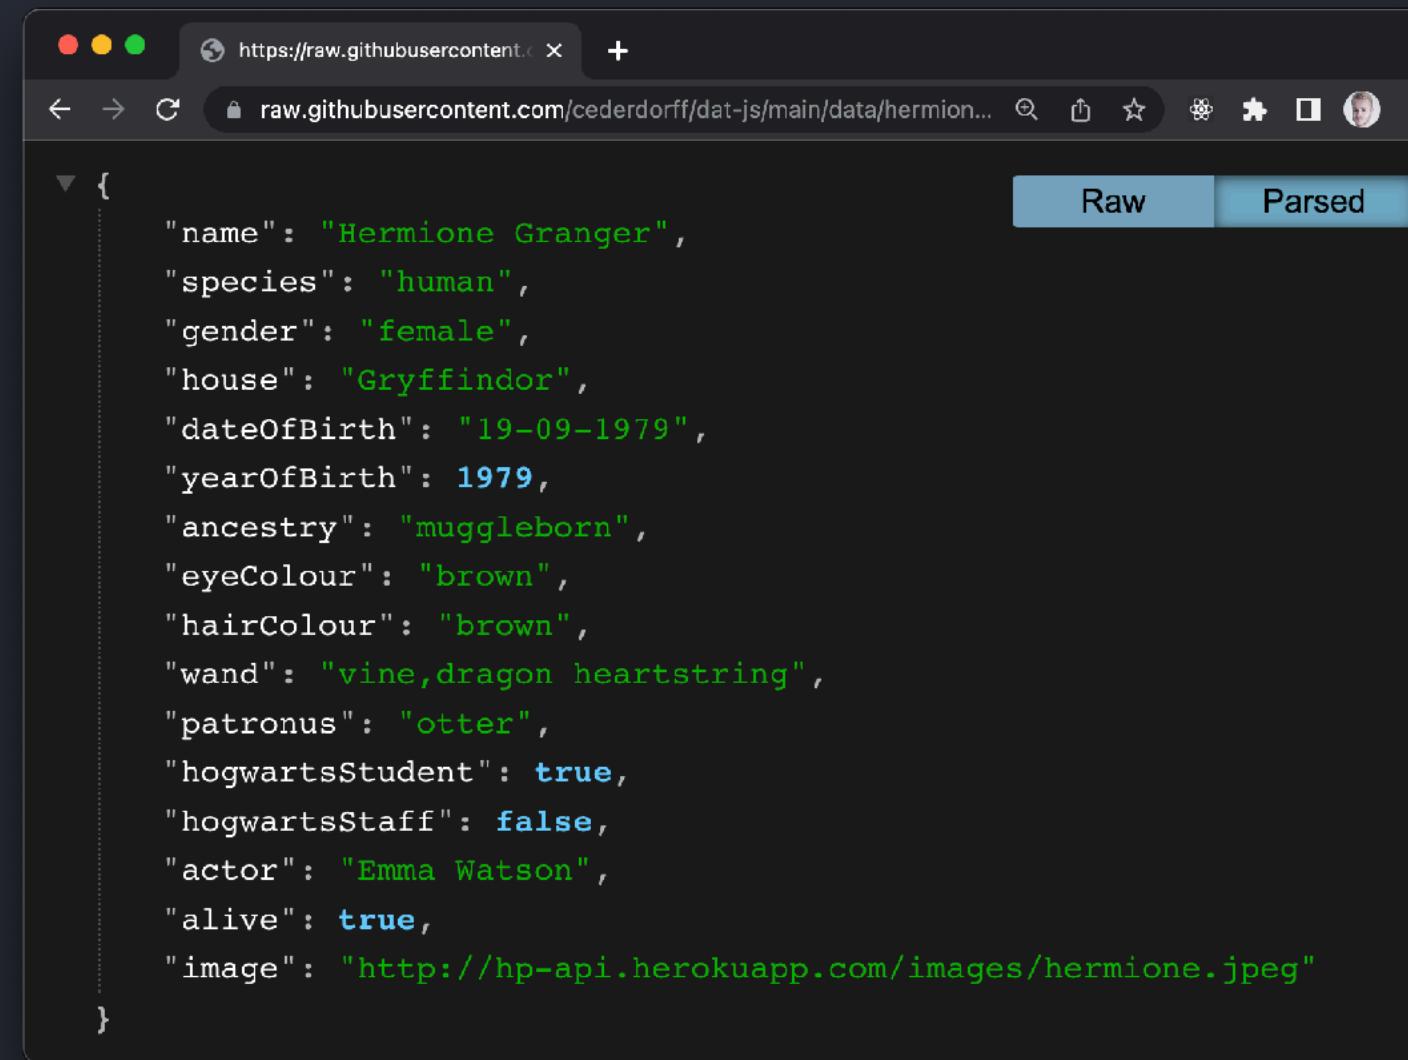

JSON Objects

A screenshot of a web browser displaying a JSON object for Harry Potter. The JSON is shown in a dark-themed code editor interface with syntax highlighting. The object contains properties such as name, species, gender, house, date of birth, year of birth, ancestry, eye colour, hair colour, wand, patronus, Hogwarts student status, staff status, actor, alive status, and image URL. A 'Raw' and 'Parsed' button is visible at the top right.

```
Raw Parsed
{
  "name": "Harry Potter",
  "species": "human",
  "gender": "male",
  "house": "Gryffindor",
  "dateOfBirth": "31-07-1980",
  "yearOfBirth": 1980,
  "ancestry": "half-blood",
  "eyeColour": "green",
  "hairColour": "black",
  "wand": "holly,phoenix feather,11",
  "patronus": "stag",
  "hogwartsStudent": true,
  "hogwartsStaff": false,
  "actor": "Daniel Radcliffe",
  "alive": true,
  "image": "http://hp-api.herokuapp.com/images/harry.jpg"
}
```

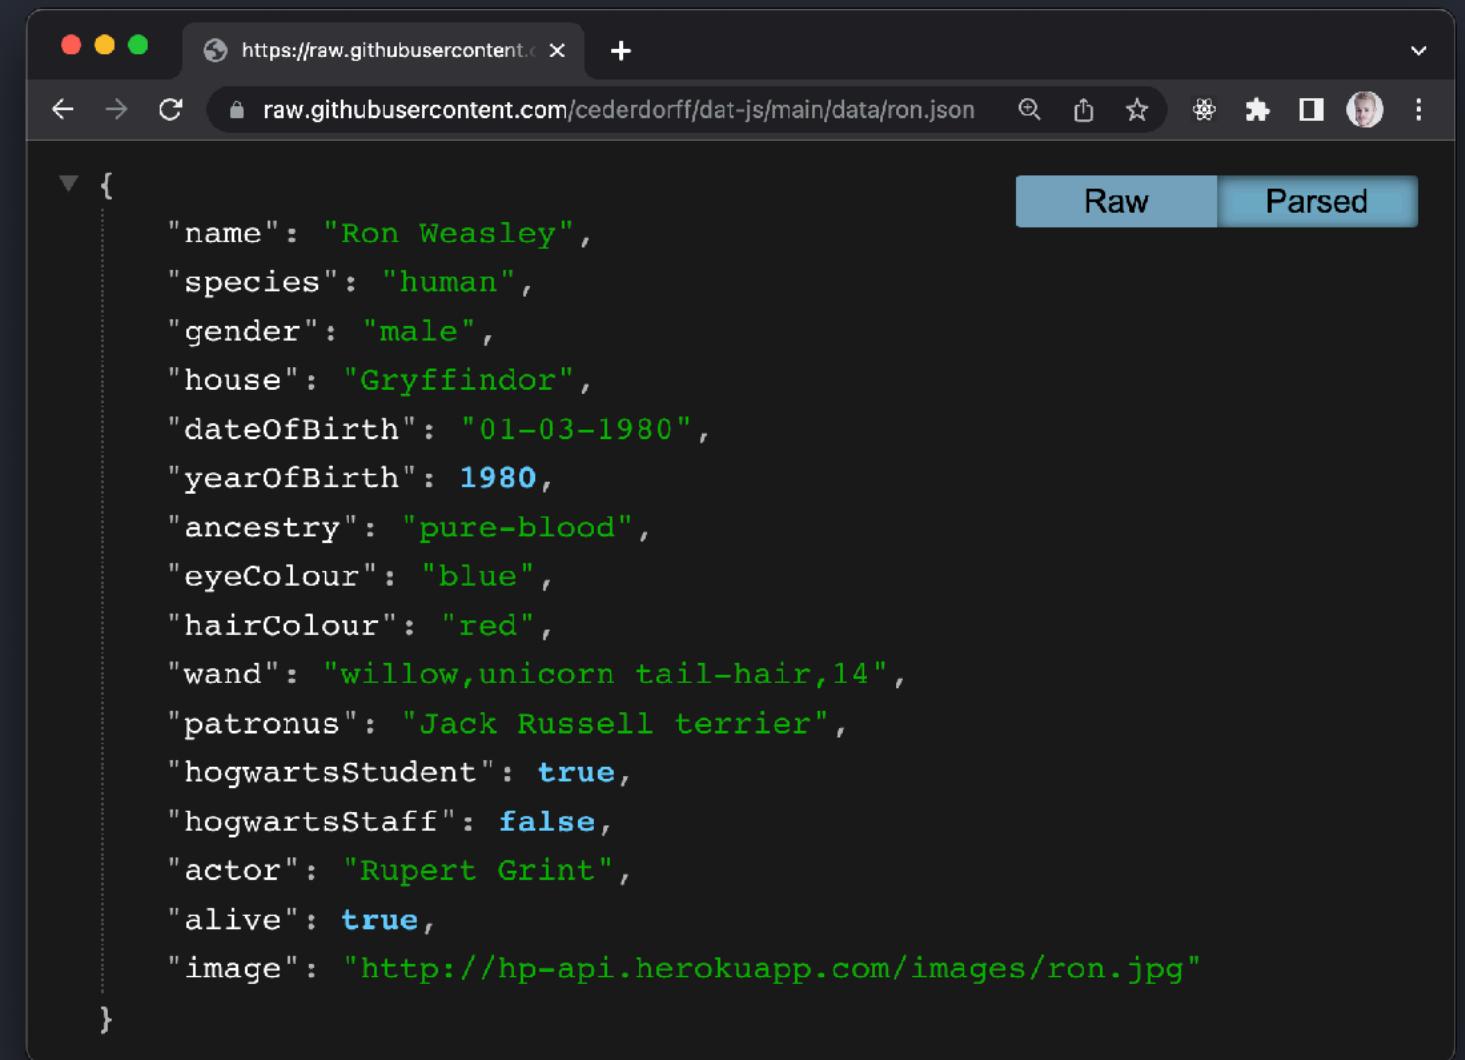

<https://raw.githubusercontent.com/cederdorff/dat-js/main/data/harry.json>

A screenshot of a web browser displaying a JSON object for Hermione Granger. The JSON is shown in a dark-themed code editor interface with syntax highlighting. The object contains properties such as name, species, gender, house, date of birth, year of birth, ancestry, eye colour, hair colour, wand, patronus, Hogwarts student status, staff status, actor, alive status, and image URL. A 'Raw' and 'Parsed' button is visible at the top right.

```
Raw Parsed
{
  "name": "Hermione Granger",
  "species": "human",
  "gender": "female",
  "house": "Gryffindor",
  "dateOfBirth": "19-09-1979",
  "yearOfBirth": 1979,
  "ancestry": "muggleborn",
  "eyeColour": "brown",
  "hairColour": "brown",
  "wand": "vine,dragon heartstring",
  "patronus": "otter",
  "hogwartsStudent": true,
  "hogwartsStaff": false,
  "actor": "Emma Watson",
  "alive": true,
  "image": "http://hp-api.herokuapp.com/images/hermione.jpeg"
}
```

<https://raw.githubusercontent.com/cederdorff/dat-js/main/data/hermione.json>

A screenshot of a web browser displaying a JSON object for Ron Weasley. The JSON is shown in a dark-themed code editor interface with syntax highlighting. The object contains properties such as name, species, gender, house, date of birth, year of birth, ancestry, eye colour, hair colour, wand, patronus, Hogwarts student status, staff status, actor, alive status, and image URL. A 'Raw' and 'Parsed' button is visible at the top right.

```
Raw Parsed
{
  "name": "Ron Weasley",
  "species": "human",
  "gender": "male",
  "house": "Gryffindor",
  "dateOfBirth": "01-03-1980",
  "yearOfBirth": 1980,
  "ancestry": "pure-blood",
  "eyeColour": "blue",
  "hairColour": "red",
  "wand": "willow,unicorn tail-hair,14",
  "patronus": "Jack Russell terrier",
  "hogwartsStudent": true,
  "hogwartsStaff": false,
  "actor": "Rupert Grint",
  "alive": true,
  "image": "http://hp-api.herokuapp.com/images/ron.jpg"
}
```

<https://raw.githubusercontent.com/cederdorff/dat-js/main/data/ron.json>

JSON Object

The diagram illustrates the relationship between a JSON object and its representation in a web application. On the left, a screenshot of a web browser shows a character card for Harry Potter from the Harry Potter Characters application. The card displays a portrait of Harry Potter, his name, house affiliation (Gryffindor), and a link to his JSON data. On the right, a screenshot of another web browser shows the raw JSON data for Harry Potter. A red arrow points from the JSON object to the Harry Potter character card, indicating that the JSON data is the source of the character's information.

Harry Potter Characters

Harry Potter

Gryffindor

Hermione Granger

Gryffindor

Ron Weasley

Gryffindor

```
name": "Harry Potter",
"species": "human",
"gender": "male",
"house": "Gryffindor",
"dateOfBirth": "31-07-1980",
"yearOfBirth": 1980,
"ancestry": "half-blood",
"eyeColour": "green",
"hairColour": "black",
"wand": "holly,phoenix feather,11",
"patronus": "stag",
"hogwartsStudent": true,
"hogwartsStaff": false,
"actor": "Daniel Radcliffe",
"alive": true,
"image": "http://hp-api.herokuapp.com/images/harry.jpg"
```

<https://raw.githubusercontent.com/cederdorff/dat-js/main/data/harry.json>

JSON Object

The diagram illustrates the flow of data between a JavaScript application and a browser's developer tools.

JavaScript Application (Left): A screenshot of a code editor showing a file named `app.js`. The code defines a function `showCharacter` that inserts an HTML article element into a container with the ID `#characters`. The article contains an image and two pieces of text: the character's name and house. The variable `character` is passed to this function.

```
28
29  function showCharacter(character) {
30      document.querySelector("#characters").insertAdjacentHTML(
31          "beforeend",
32          /*html*/
33          `

34              
35              <h2>${character.name}</h2>
36              <p>${character.house}</p>
37          </article>
38      `);
39  }
40 }

```

Browser Console (Right): A screenshot of a browser window displaying a JSON object. The object represents a character named Harry Potter, detailing his species, gender, house, birth dates, ancestry, eye and hair colors, wand, patronus, and current status. An arrow points from the `character` variable in the `showCharacter` function to this JSON object, indicating it is the data being passed.

```
{
  "name": "Harry Potter",
  "species": "human",
  "gender": "male",
  "house": "Gryffindor",
  "dateOfBirth": "31-07-1980",
  "yearOfBirth": 1980,
  "ancestry": "half-blood",
  "eyeColour": "green",
  "hairColour": "black",
  "wand": "holly,phoenix feather,11",
  "patronus": "stag",
  "hogwartsStudent": true,
  "hogwartsStaff": false,
  "actor": "Daniel Radcliffe",
  "alive": true,
  "image": "http://hp-api.herokuapp.com/images/harry.jpg"
}
```

<https://raw.githubusercontent.com/cederdorff/dat-js/main/data/harry.json>

JAVASCRIPT OBJECT NOTATION

- Collection of key-value pair: “key” : “value”
- List of values, collections or objects
- Lightweight data-interchange format
- Syntax / text format for storing and exchanging data over the web
- Human and machine readable **text**: small, fast and simple
- Language independent
- Can be parsed directly to JavaScript Object
- JavaScript Objects can be converted directly to JSON
- The glue between programs (interface between frontend and backend)

```
[  
 {  
   "id": "1",  
   "firstname": "Kasper",  
   "lastname": "Topp",  
   "age": "34",  
   "haircolor": "Dark Blonde",  
   "countryName": "Denmark",  
   "gender": "Male",  
   "lookingFor": "Female"  
 },  
 {  
   "id": "2",  
   "firstname": "Nicklas",  
   "lastname": "Andersen",  
   "age": "22",  
   "haircolor": "Brown",  
   "countryName": "Denmark",  
   "gender": "Male",  
   "lookingFor": "Female"  
 },  
 {  
   "id": "3",  
   "firstname": " Sarah",  
   "lastname": "Dybvad ",  
   "age": "34",  
   "haircolor": "Blonde",  
   "countryName": "Denmark",  
   "gender": "Female",  
   "lookingFor": "Male"  
 },  
 {  
   "id": "4",  
   "firstname": "Alex",  
   "lastname": "Hansen",  
   "age": "21",  
   "haircolor": "Blonde",  
   "countryName": "Denmark",  
   "gender": "Male",  
   "lookingFor": "Female"  
 }]
```

JSON Methods

```
const user = {  
    name: "John",  
    age: 30,  
    gender: "male",  
    lookingFor: "female"  
};  
  
// === JSON.stringify === //  
const jsonUser = JSON.stringify(user);  
console.log(jsonUser); // {"name":"John","age":30,"gender":"male","lookingFor":"female"}  
  
// === JSON.parse === //  
const jsonString = '{"name":"John","age":30,"gender":"male","lookingFor":"female"}';  
const userObject = JSON.parse(jsonString);  
console.log(userObject); // logging userObject
```

JSON.parse()

Converts a string
(JSON) to a JavaScript
Object or Array.

```
// User as a text string
const userString = '{"name":"John", "age":30, "city":"New York"}';
// Converts the text into a JavaScript Object
const userObject = JSON.parse(userString);
console.log(userObject);
```

```
// Cars as a text string
const carsString = '[{"Ford", "BMW", "Audi", "Fiat", "VW"}]';
// Converts the text into a JavaScript Array
const carsArray = JSON.parse(carsString);
console.log(carsArray);
```

JSON.stringify()

Converts a JavaScript Object or Array to a string (JSON).

```
// User as a JavaScript Object
const user = { name: "John", age: 30, city: "New York" };
// Converts user object to JSON string
const userJSON = JSON.stringify(user);
console.log(userJSON);
```

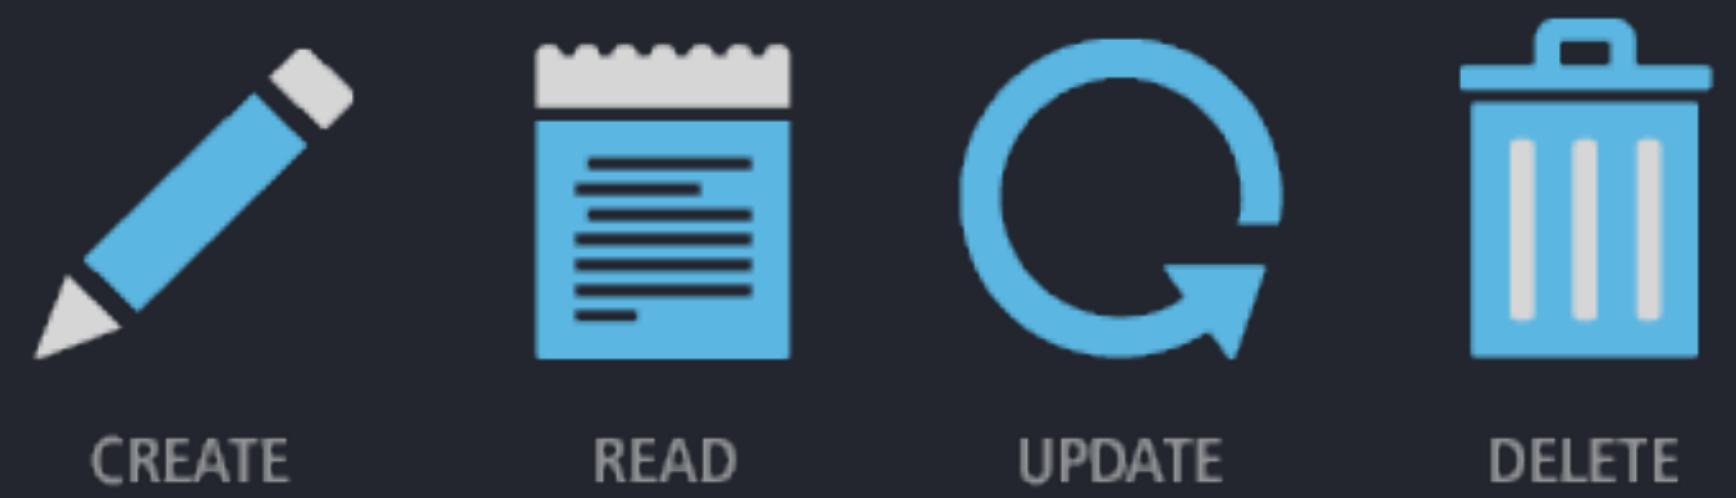

```
// Cars as a JavaScript Array
const cars = ["Ford", "BMW", "Audi", "Fiat", "Vw"];
// Converts cars array to JSON string
const carsJSON = JSON.stringify(cars);
console.log(carsJSON);
```

Fetch and create post

newPost object is parsed
to JSON and posted to the
ressource wrapped in body

```
// new post object
const newPost = {
  title: "My new post",
  body: "Body description of a new post",
  image: "image url or image data string"
};

const url = "https://race-rest-default.firebaseio.com/posts.json";
const response = await fetch(url, {
  method: "POST", // fetch request using POST
  body: JSON.stringify(newPost) //←newPost object to JSON
});
```

C R U D

What's CRUD?

- CREATE objects like a post, user, movie, product, etc.
- READ objects like an array (or object) of objects (posts, users, movies, products, etc)
- UPDATE an object, often given by a unique id.
- DELETE an object, often given by a unique id.

What's REST?

GET

POST

PUT

DELETE

- REpresentational State Transfer
- A standard for systems (client & server) to communicate over HTTP in order to retrieve or modify (data) resources.
- Stateless, meaning the two systems doesn't need to know anything about the state.
- The client makes the requests using the 4 basic HTTP verbs to define the operation.

Dataforsyningen REST API

... an example of a REST API

<https://dataforsyningen.dk/>

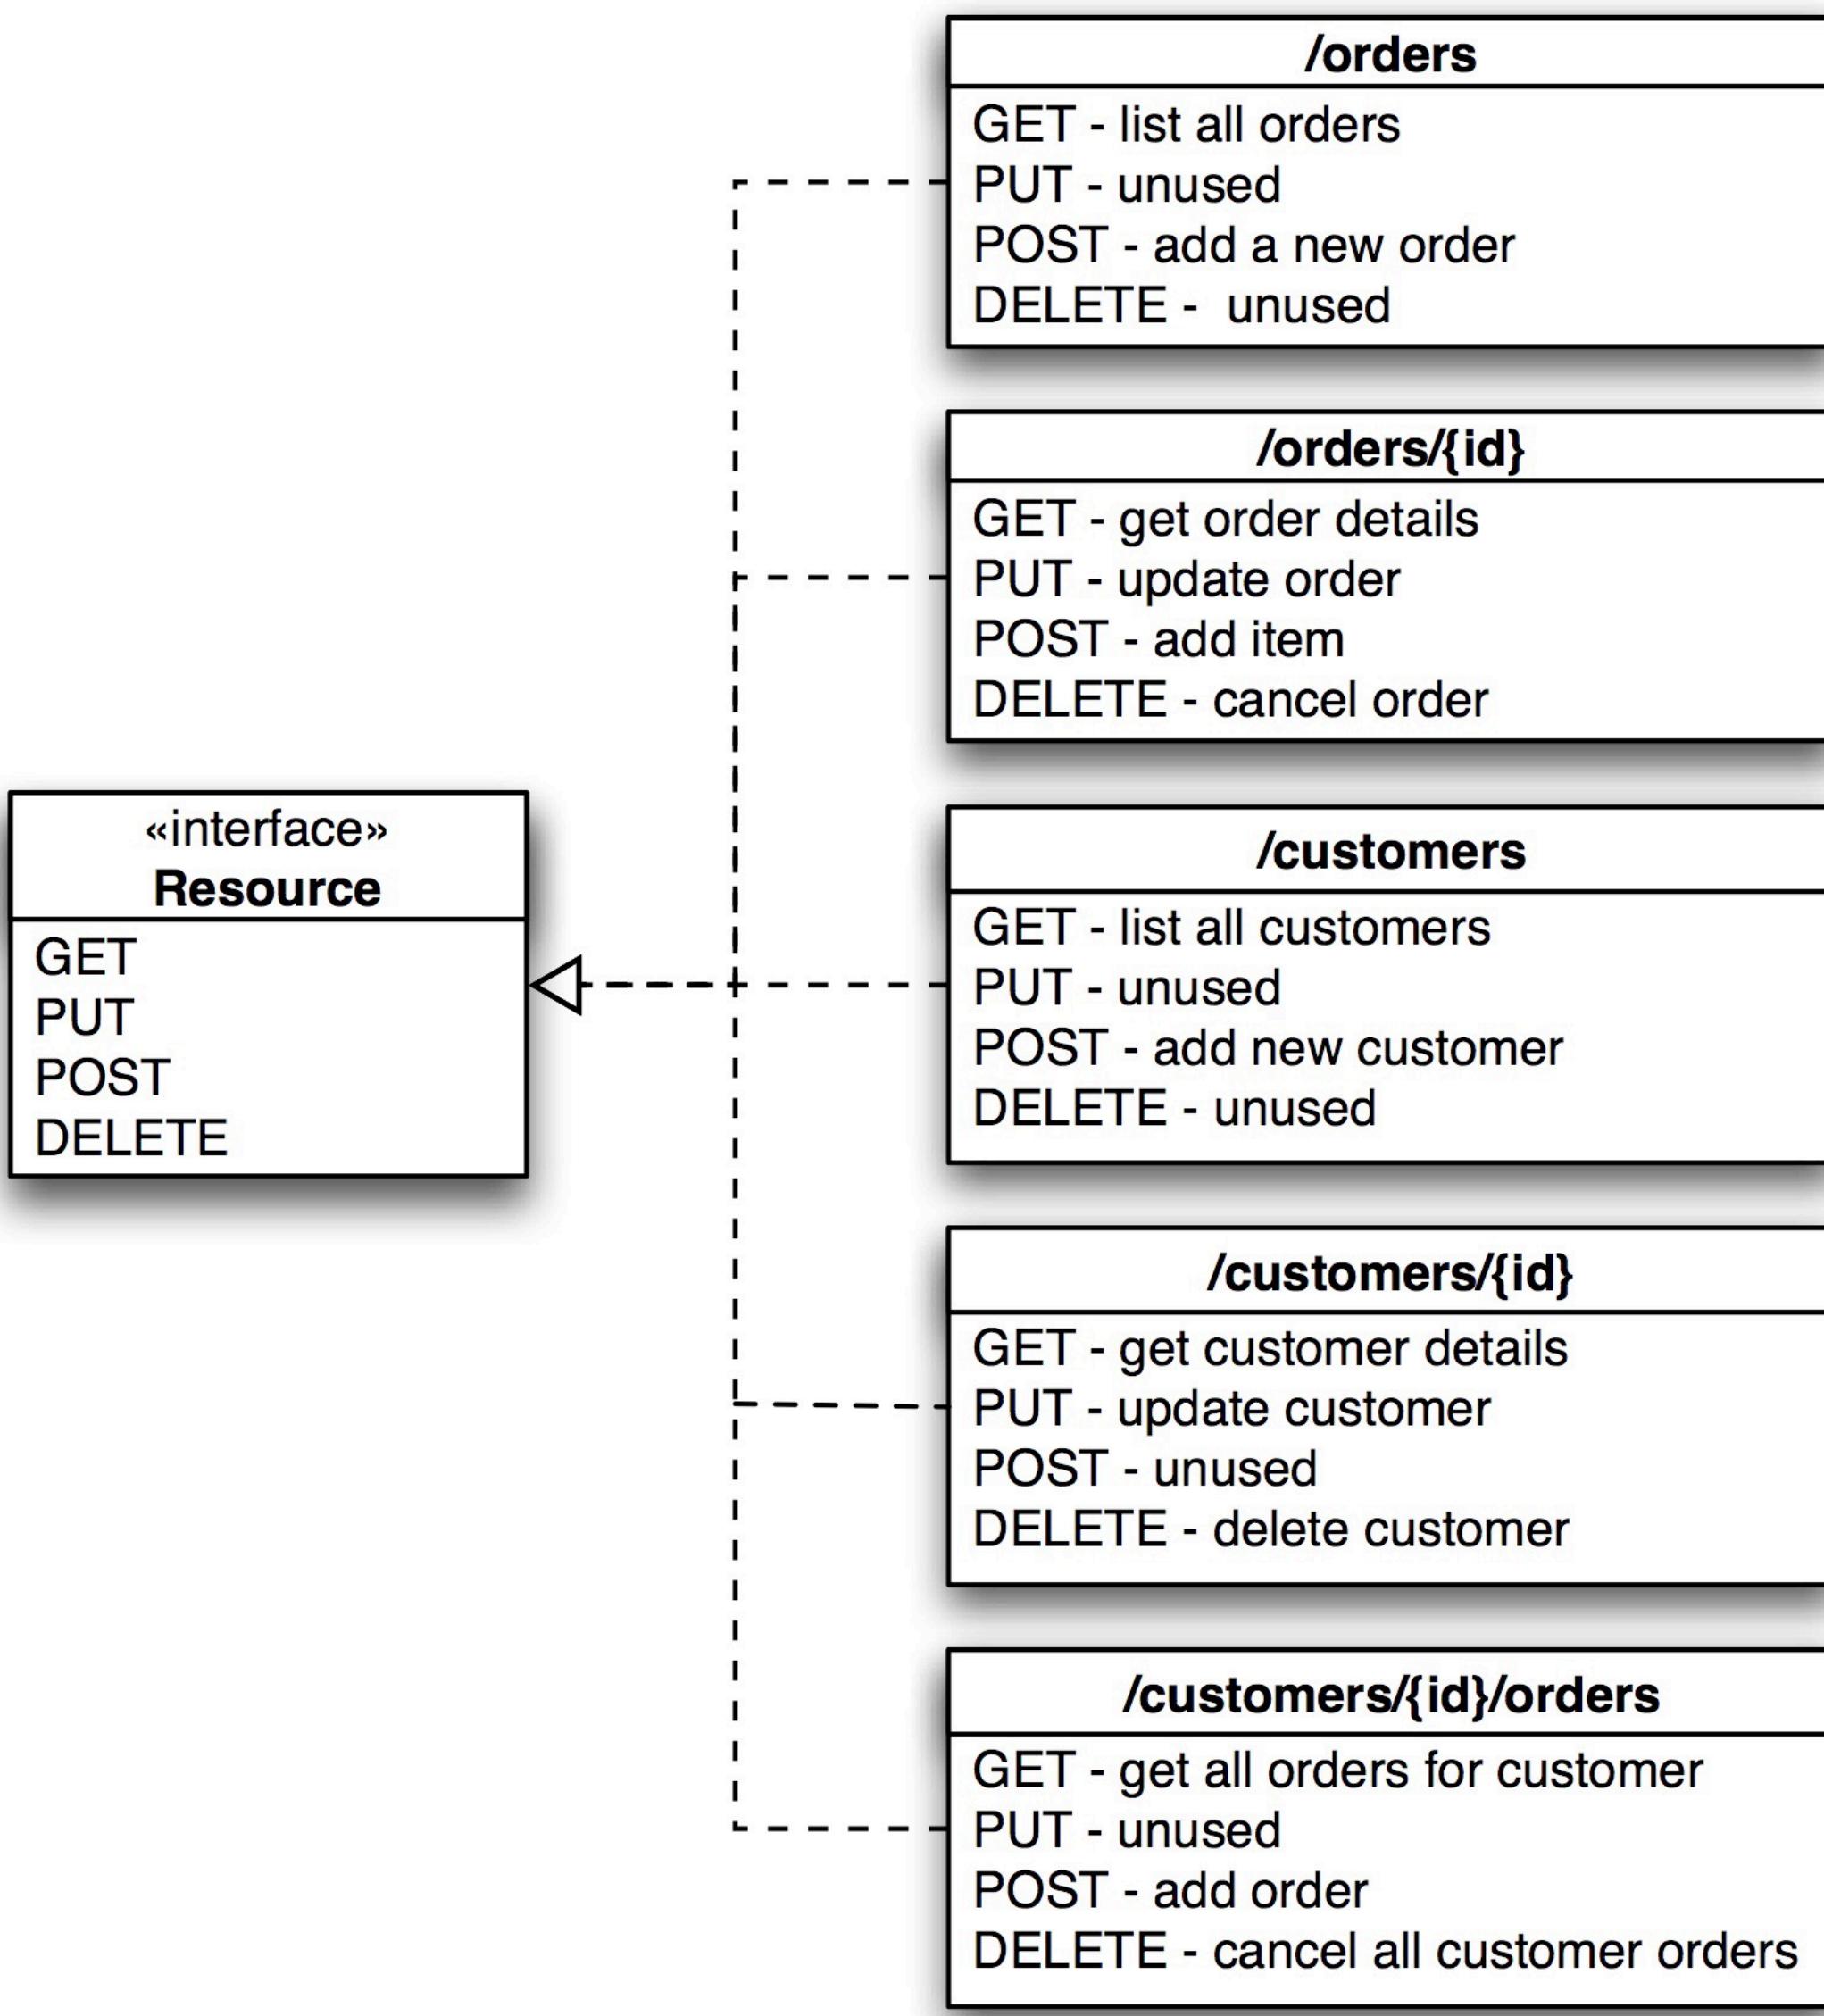

The screenshot shows the REST API documentation page. The title "Dataforsyningen REST API" is at the top. Below it, there are links to the API (<https://api.dataforsyningen.dk/>), documentation (<https://dataforsyningen.dk/>), and a data overview (<https://dataforsyningen.dk/data>). A section titled "Eksempel på kald" (Example call) lists "Danmarks adresser og vejnavne" with the URL <https://dataforsyningen.dk/data/4729> and "Docs (REST Services)" with the URL <https://dawadocs.dataforsyningen.dk/dok/api>. Another section titled "Regioner" (Regions) shows "alle regioner" (all regions) with a GET request to <https://api.dataforsyningen.dk/regioner> and "en region" (one region) with a GET request to <https://api.dataforsyningen.dk/regioner/1082>.

[Dataforsyningen REST API](#)

REpresentational State Transfer

- Clean, semantic URL:
 - <http://example.com/products/2/25> instead of:
 - [http://example.com/products?
category=2&id=25](http://example.com/products?category=2&id=25)
- Basic HTTP requests to perform create, read, update and delete with the HTTP methods GET, POST, PUT and DELETE

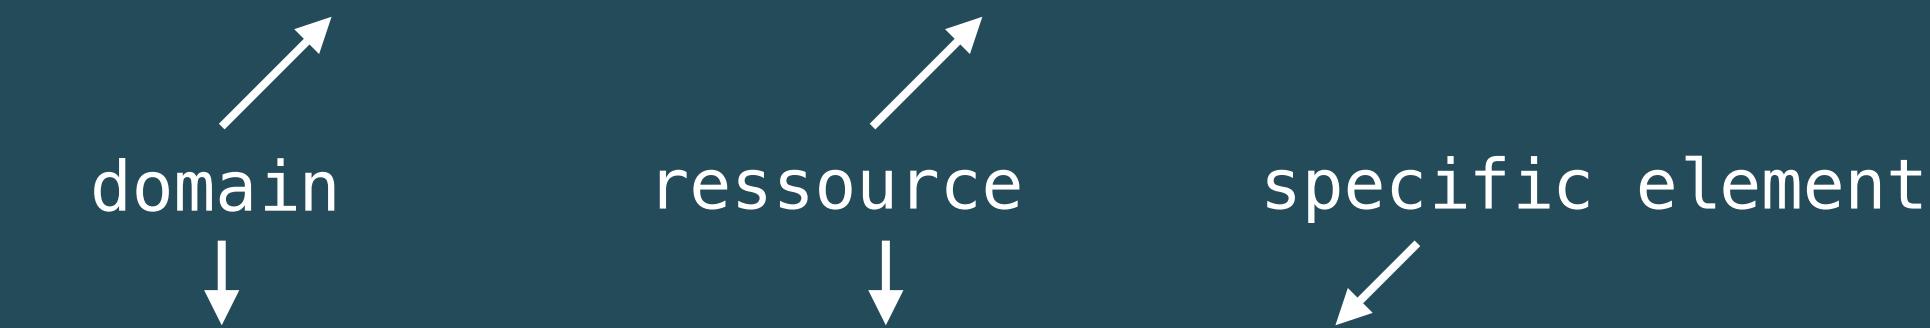

Principles of REST

- Ressources and endpoints:
 - <http://example.com/products>
 - <http://example.com/users>
 - <http://domain.com/orders>
- Everything must have an id:
 - <http://example.com/products/2/25>
 - <http://example.com/users/7503>
 - <http://domain.com/orders/2014/06/4022>
- Connect data
 - <http://example.com/users/7503/orders/3/item/1>
- Standard HTTP request methods (GET, POST, PUT, DELETE)
- Exchanges data, often JSON (oldschool: XML)
- Stateless Communication

RESTful API

- Base URL (endpoint): http://some-url.com/products

- http://some-url.com/products/product1

- Data type → JSON

Ressource	GET	POST	PUT	DELETE
Collection: <u>http://some-url.com/products</u>	Returns a list with all products	Creates new product, added to the collections	Replaces a collection with a another	Deletes all products
Element: <u>http://some-url.com/products/product1</u>	Returns a specific product	÷	Replaces product with new (updated) data	Deletes product

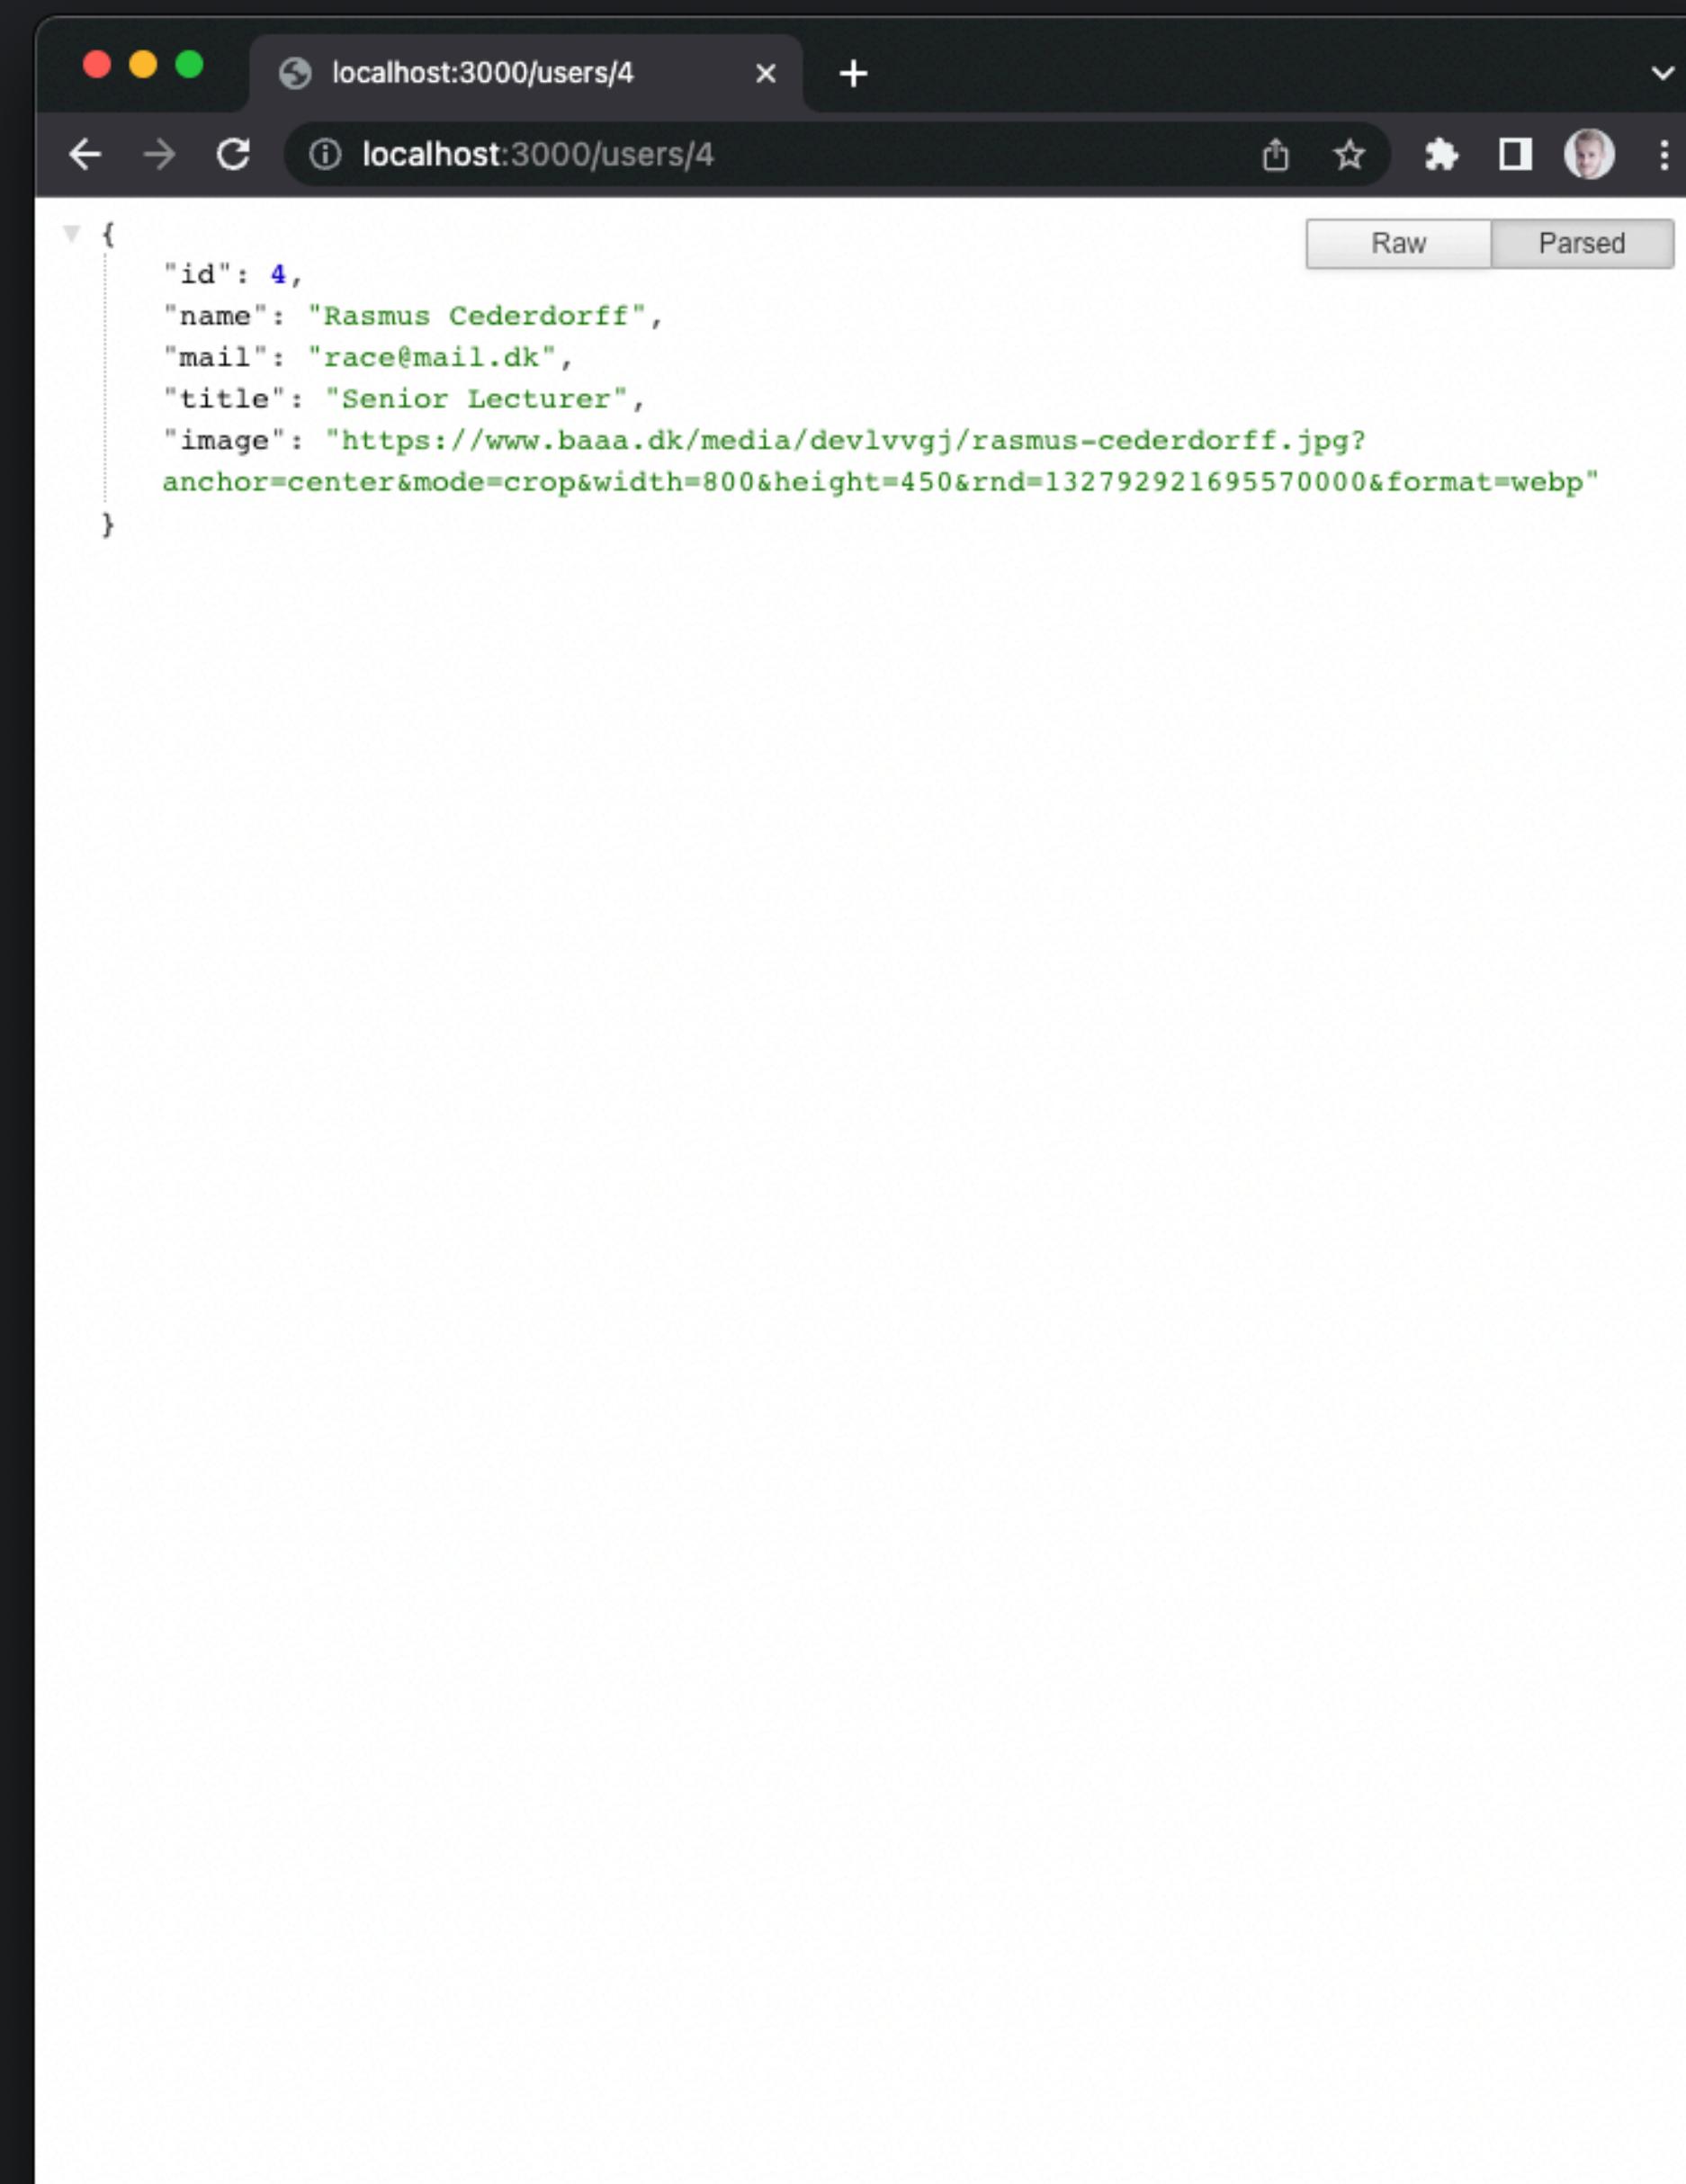

Collections (JSON Array)

A screenshot of a web browser window titled "localhost:3000/users". The page displays a JSON array of user objects. Each object contains fields: id, name, mail, title, and image. The image field includes a URL and a query string for image processing. The browser interface shows "Raw" and "Parsed" buttons.

```
[{"id": 1, "name": "Birgitte Kirk Iversen", "mail": "bki@mail.dk", "title": "Senior Lecturer", "image": "https://www.baaa.dk/media/u4gorzsd/birgitte-kirk-iversen2.jpg?anchor=center&mode=crop&width=800&height=450&rnd=132792921541630000&format=webp"}, {"id": 4, "name": "Rasmus Cederdorff", "mail": "race@mail.dk", "title": "Senior Lecturer", "image": "https://www.baaa.dk/media/devlvgj/rasmus-cederdorff.jpg?anchor=center&mode=crop&width=800&height=450&rnd=132792921695570000&format=webp"}, {"id": 5, "name": "Dan Okkels Brendstrup", "mail": "dob@mail.dk", "title": "Lecturer", "image": "https://www.eaaa.dk/media/bdojel41/dan-okkels-brendstrup.jpg?anchor=center&mode=crop&width=800&height=450&rnd=132792921559630000&format=webp"}, {"id": 6, "name": "Kasper Fischer Topp", "mail": "kato@mail.dk", "title": "Lecturer", "image": "https://www.eaaa.dk/media/lxzcybme/kasper-topp.jpg?anchor=center&mode=crop&width=800&height=450&rnd=132792921618200000&format=webp"}, {"id": 7, "name": "Line Skjødt", "mail": "lskj@mail.dk", "title": "Senior Lecturer & Internship Coordinator", "image": "https://www.eaaa.dk/media/14qpfeq4/line-skj%C3%B8dt.jpg?anchor=center&mode=crop&width=800&height=450&rnd=132792921638700000&format=webp"}, {"id": 8, "name": "Martin Aagaard Nøhr", "mail": "mnor@mail.dk", "title": "Lecturer", "image": "https://www.eaaa.dk/media/oayjq02h/martin-n%C3%B8hr.jpg?anchor=center&mode=crop&width=800&height=450&rnd=132792921658800000&format=webp"}]
```

Element (JSON Object)

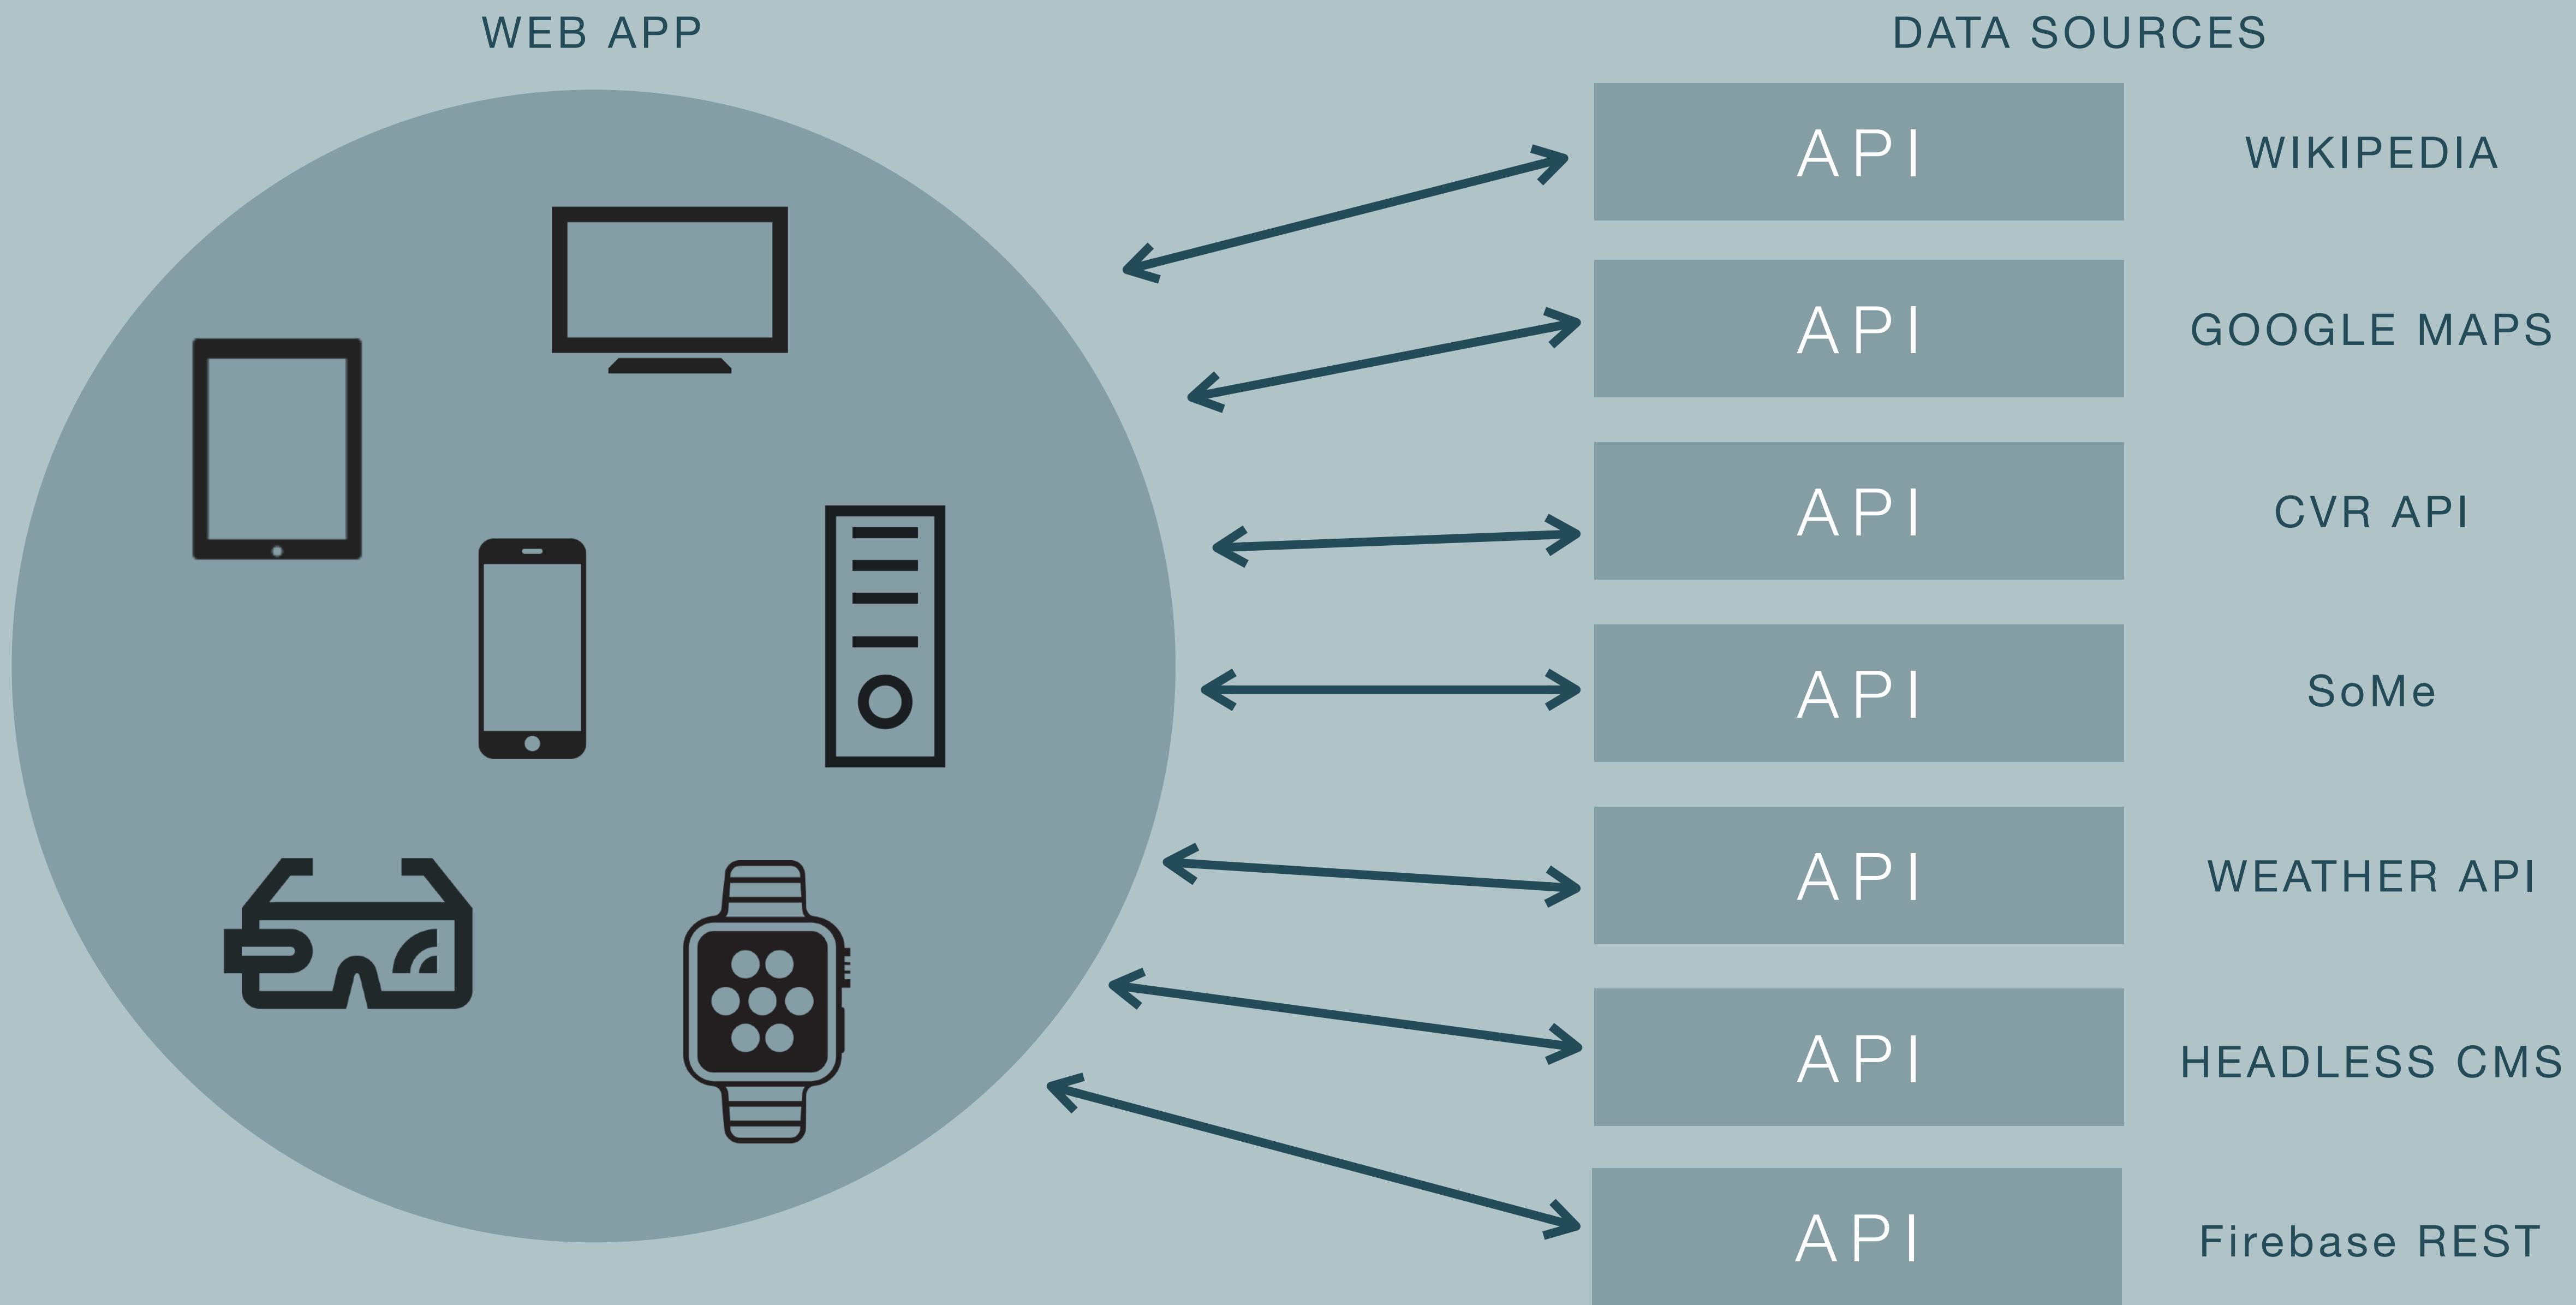

A screenshot of a web browser window titled "localhost:3000/users/4". The page displays a single JSON object representing a user with id 4. The object includes fields: id, name, mail, title, and image. The image field includes a URL and a query string for image processing. The browser interface shows "Raw" and "Parsed" buttons.

```
{ "id": 4, "name": "Rasmus Cederdorff", "mail": "race@mail.dk", "title": "Senior Lecturer", "image": "https://www.baaa.dk/media/devlvgj/rasmus-cederdorff.jpg?anchor=center&mode=crop&width=800&height=450&rnd=132792921695570000&format=webp"}
```

Advantages of REST

- Independent of platform and programming language
- Based on existing standards (on top of HTTP)
- Semantic URL → Nice and clean URLs → SEO
- Restful API
- Scalable
- Performance
- Exchange formats like JSON, XML, or both

API

HTTP REQUEST METHODS (verbs)

GET - POST - PUT - DELETE

HTTP (Hypertext Transfer Protocol) is the standard way to communicate between clients and servers (request-response protocol).

"HTTP defines a set of **request methods** to indicate the desired action to be performed for a given resource."

https://www.w3schools.com/tags/ref_httpmethods.asp

<https://developer.mozilla.org/en-US/docs/Web/HTTP/Methods>

CRUD vs REST & HTTP Verbs

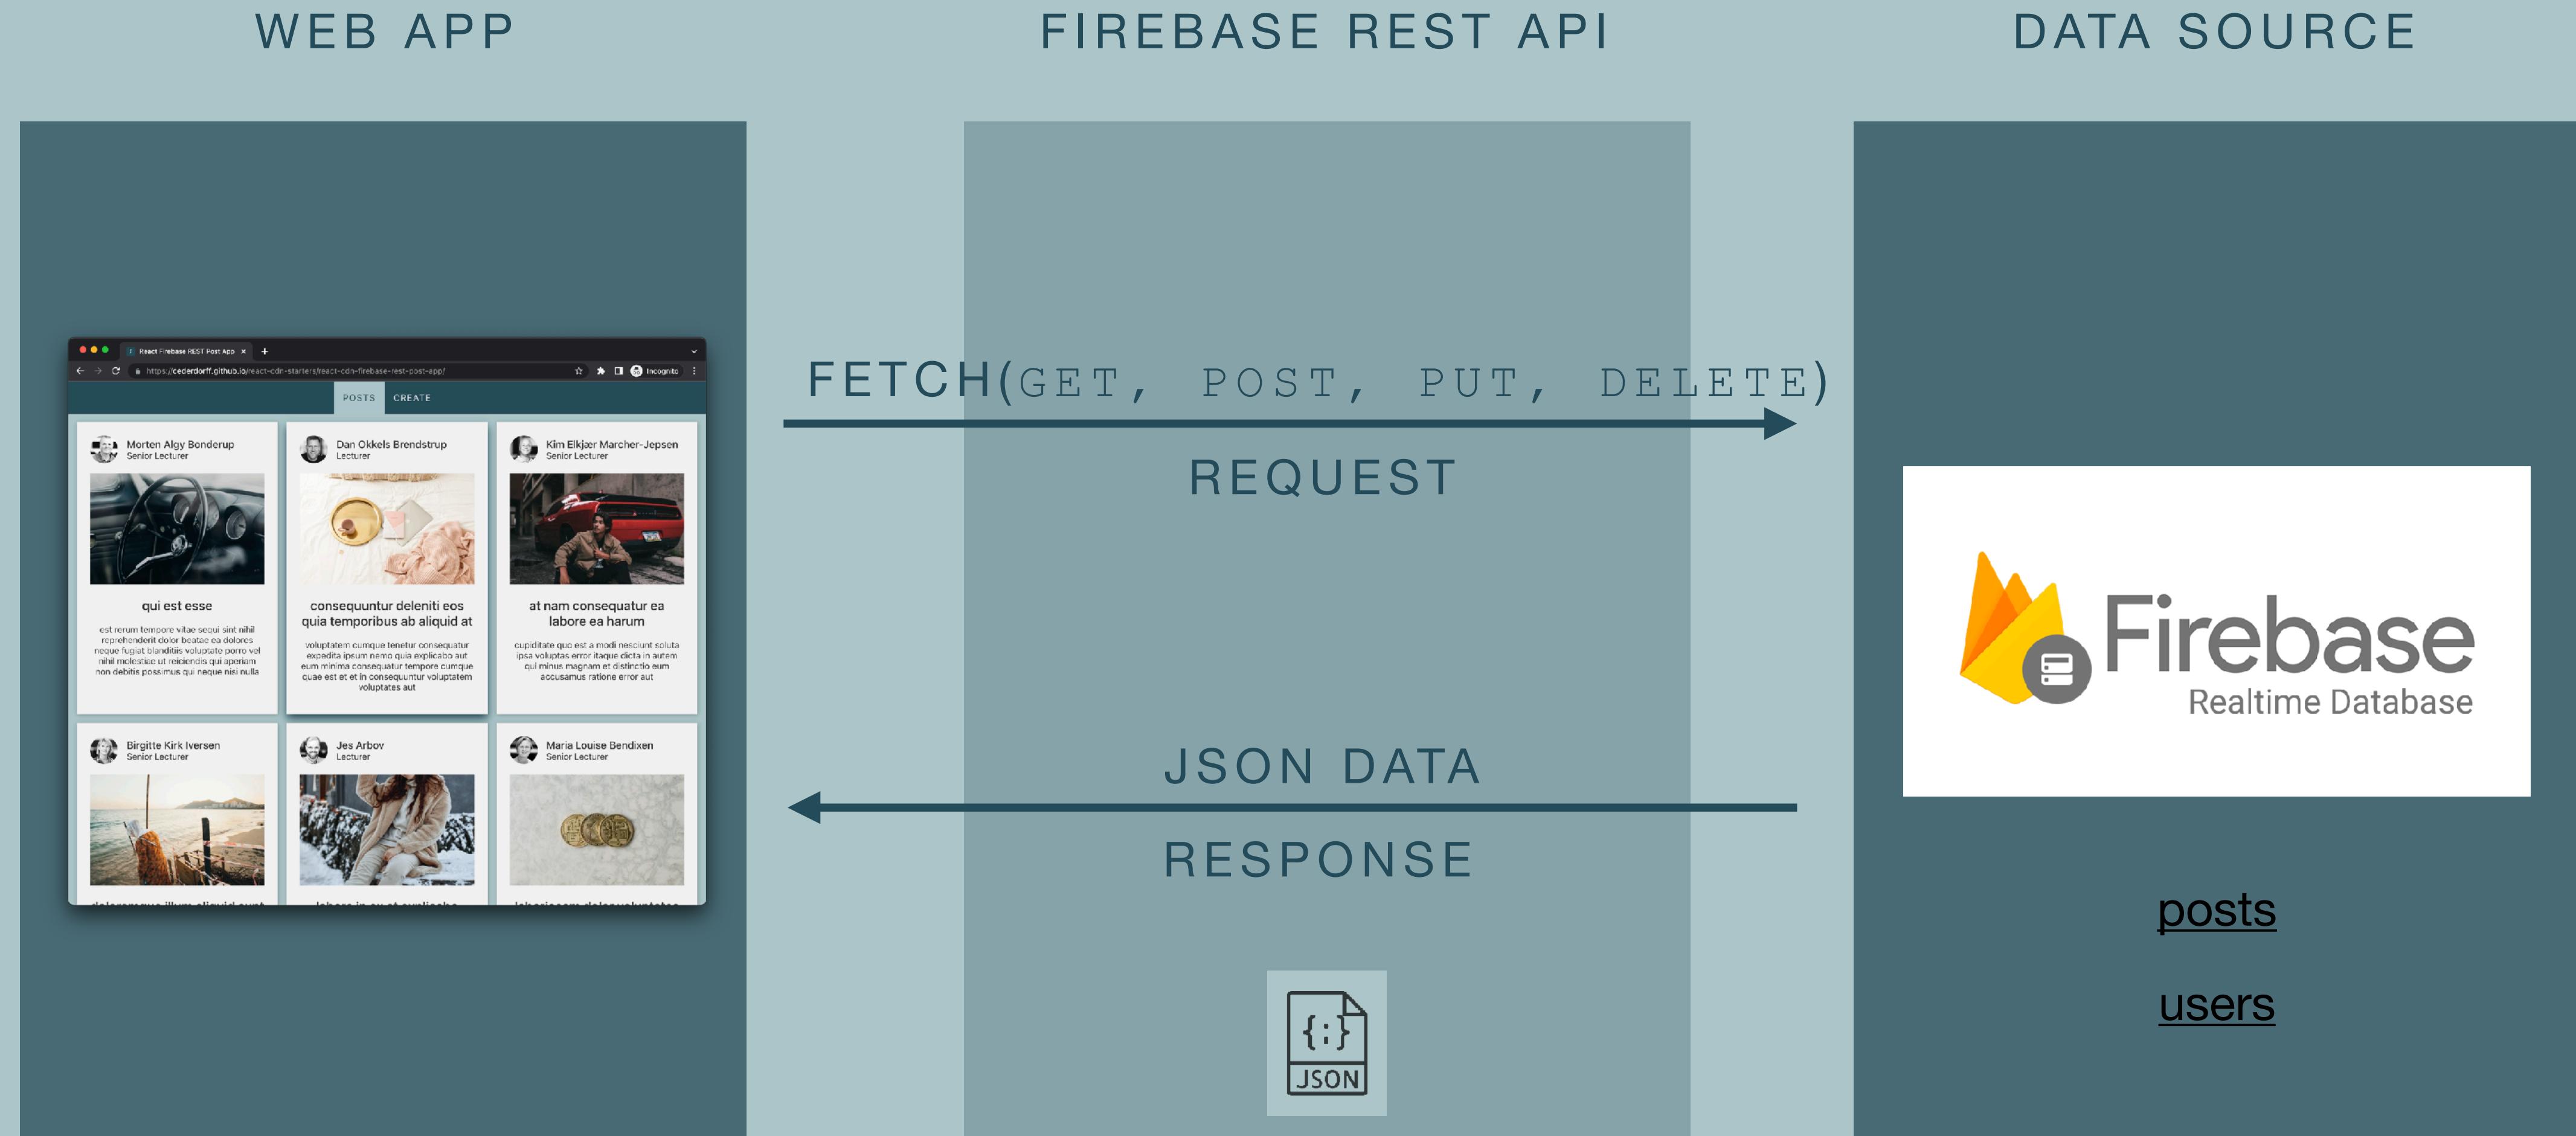

CREATE -> POST: create a new resource (object)

READ -> GET: retrieve a specific resource or a collection

UPDATE -> PUT: update a specific resource (by id)

DELETE -> DELETE: remove a specific resource by id

Fetch, HTTP Request & Response

Fetch and read posts

GET is the default request method for fetch.

```
async function getPosts() {  
  const url = "https://race-rest-default-rtbd.firebaseio.com/posts.json";  
  const response = await fetch(url);  
  const data = await response.json();  
  const postsArray = Object.keys(data).map(key => ({ id: key, ...data[key] })); // from object to array  
  return postsArray  
}
```

REQUEST headers

“[...] contain more information about the resource to be fetched, or about the client requesting the resource.”

"A request header is an HTTP header that can be used in an HTTP request to provide information about the request context, so that the server can tailor the response. For example, the Accept-* headers indicate the allowed and preferred formats of the response. Other headers can be used to supply authentication credentials (e.g. Authorization), to control caching, or to get information about the user agent or referrer, etc."

<https://developer.mozilla.org/en-US/docs/Web/HTTP/Headers>

https://developer.mozilla.org/en-US/docs/Glossary/Request_header

Request body

With the HTTP Fetch Request, we can send (POST) data. The data is wrapped inside the **request body**.

The **request body** is one of the following:

- a string (often JSON-encoded string with data, an object, an array, etc.)
- form data (form/multipart)
- blob/ buffer source - binary data
- URL search params (x-www-form-urlencoded)

```
async function createUser(name, title, mail, image) {  
    // create a new user  
    const newUser = { name, title, mail, image };  
    // convert to JSON  
    const userAsJSON = JSON.stringify(newUser);  
    // make fetch post request with userAsJSON in request body  
    const response = await fetch(` ${endpoint}/users.json`, {  
        method: "POST",  
        body: userAsJSON  
    });  
  
    // check if ok (status 200)  
    if (response.ok) {  
        // if success update the DOM  
    }  
}
```

Request body

POST

```
async function createUser(name, mail) {
  const user = {
    name: name,
    mail: mail
  };

  const response = await fetch(` ${endpoint}/users`, {
    method: "POST",
    body: JSON.stringify(user)
  });

  if (response.ok) {
    // if success, update the users grid
    updateUsersGrid();
  }
}
```

PUT

```
async function updateUser(id, name, mail) {
  const userToUpdate = { name: name, mail: mail };

  const response = await fetch(` ${endpoint}/users/${id}.json`, {
    method: "PUT",
    body: JSON.stringify(userToUpdate)
  });

  if (response.ok) {
    const data = await response.json();
    console.log("User updated:", data);
    updateUserGrid();
  } else {
    console.log("Sorry, something went wrong");
  }
}
```

The slides is your documentation

Read and use them carefully

when you ask Rasmus
for help and he says
"Read documentation"

Fetch and create post

Using POST to create a new post object in the resource.

```
// new post object
const newPost = {
  title: "My new post",
  body: "Body description of a new post",
  image: "image url or image data string"
};

const url = "https://race-rest-default-firebaseio.com/posts.json";
const response = await fetch(url, {
  method: "POST", // fetch request using POST
  body: JSON.stringify(newPost) // newPost object to JSON
});
```

Fetch and update post

Using PUT to an existing post object by given id.

```
const postId = "5tl4jHHSRaKEB0UW9nQd"; // id of the object to update
const postToUpdate = { title: "...", body: "...", image: "..." };

const url = `https://race-rest-default-firebase.firebaseio.com/posts/${postId}.json`;
const response = await fetch(url, {
  method: "PUT", // using HTTP method PUT
  body: JSON.stringify(postToUpdate)
});
```

Fetch and delete post

Using DELETE to an object by given id.

```
const postId = "5tl4jHHSRaKEB0UW9nQd"; // id of the object to update
const url = `https://race-rest-default-rtdb.firebaseio.com/posts/${postId}.json`;

const response = await fetch(url, {
  method: "DELETE"
});
```

What is Firebase?

Platform, a suite of tools & Backend-as-a-Service
for Web & App Development

100 *SECONDS OF*

Introducing Firebase

<https://www.youtube.com/watch?v=iosNuldQoy8>

Build better apps

Cloud Firestore

Store and sync app data at global scale

ML Kit BETA

Machine learning for mobile developers

Cloud Functions

Run mobile backend code without managing servers

Authentication

Authenticate users simply and securely

Hosting

Deliver web app assets with speed and security

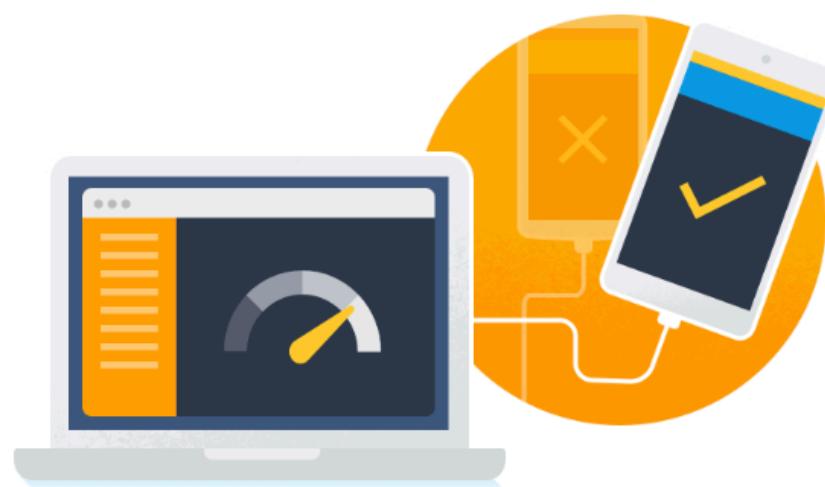

Cloud Storage

Store and serve files at Google scale

Realtime Database

Store and sync app data in milliseconds

Improve app quality

Crashlytics

Prioritize and fix issues with powerful, realtime crash reporting

Performance Monitoring

Gain insight into your app's performance

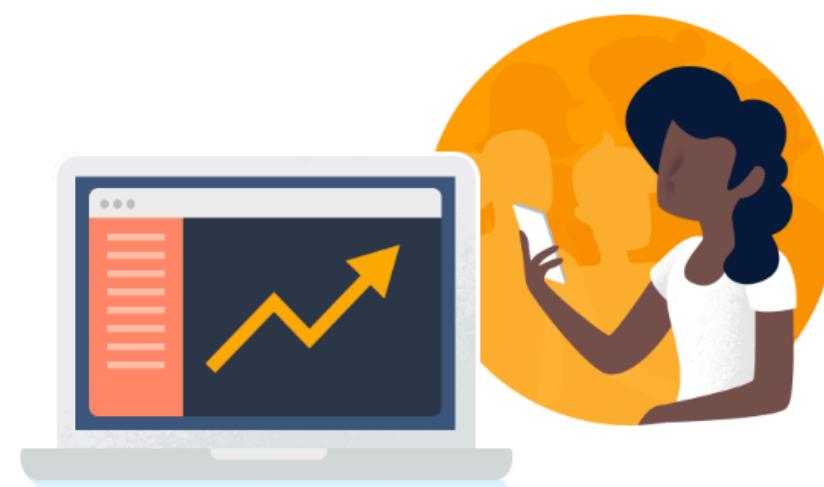

Test Lab

Test your app on devices hosted by Google

App Distribution BETA

Distribute pre-release versions of your app to your trusted testers

Grow your business

In-App Messaging BETA

Engage active app users with contextual messages

Google Analytics

Get free and unlimited app analytics

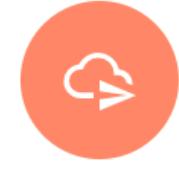

Predictions

Smart user segmentation based on predicted behavior

A/B Testing BETA

Optimize your app experience through experimentation

Cloud Messaging

Send targeted messages and notifications

Remote Config

Modify your app without deploying a new version

Dynamic Links

Drive growth by using deep links with attribution

Realtime Database & REST API

Store and sync data in real time
REST API or SDK

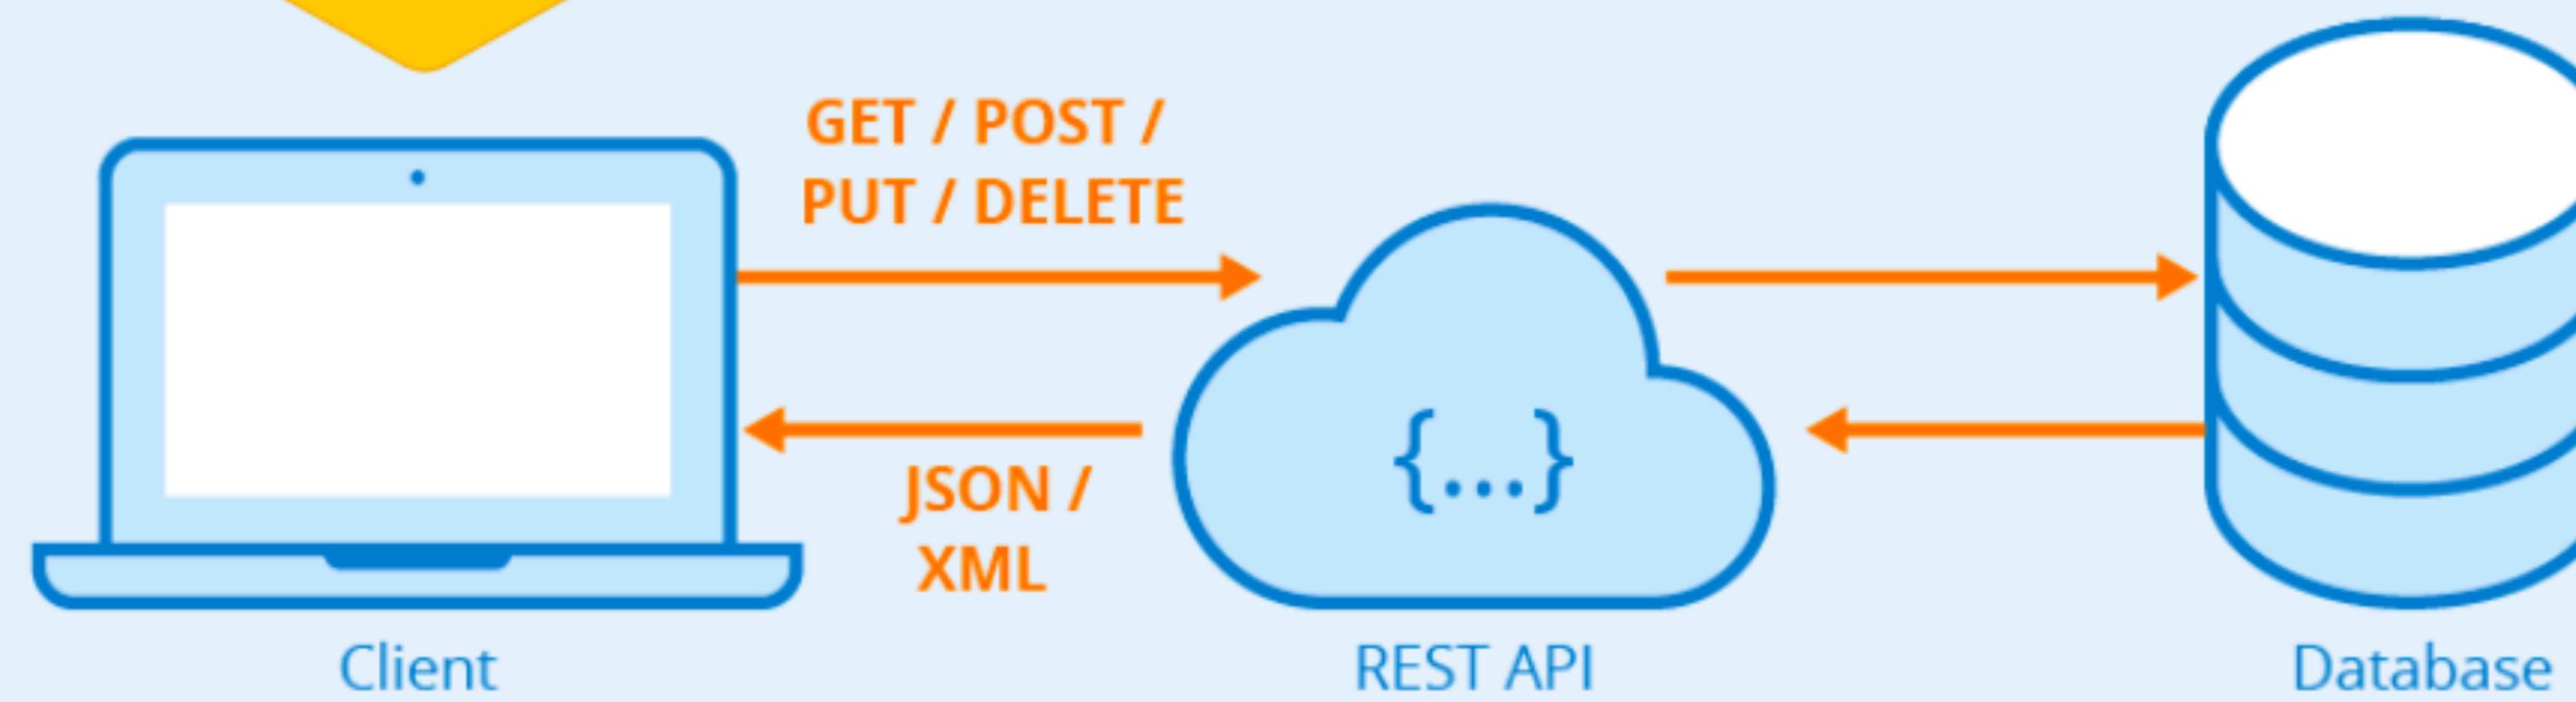

<https://firebase.google.com/products/realtime-database>

Database

Firebase

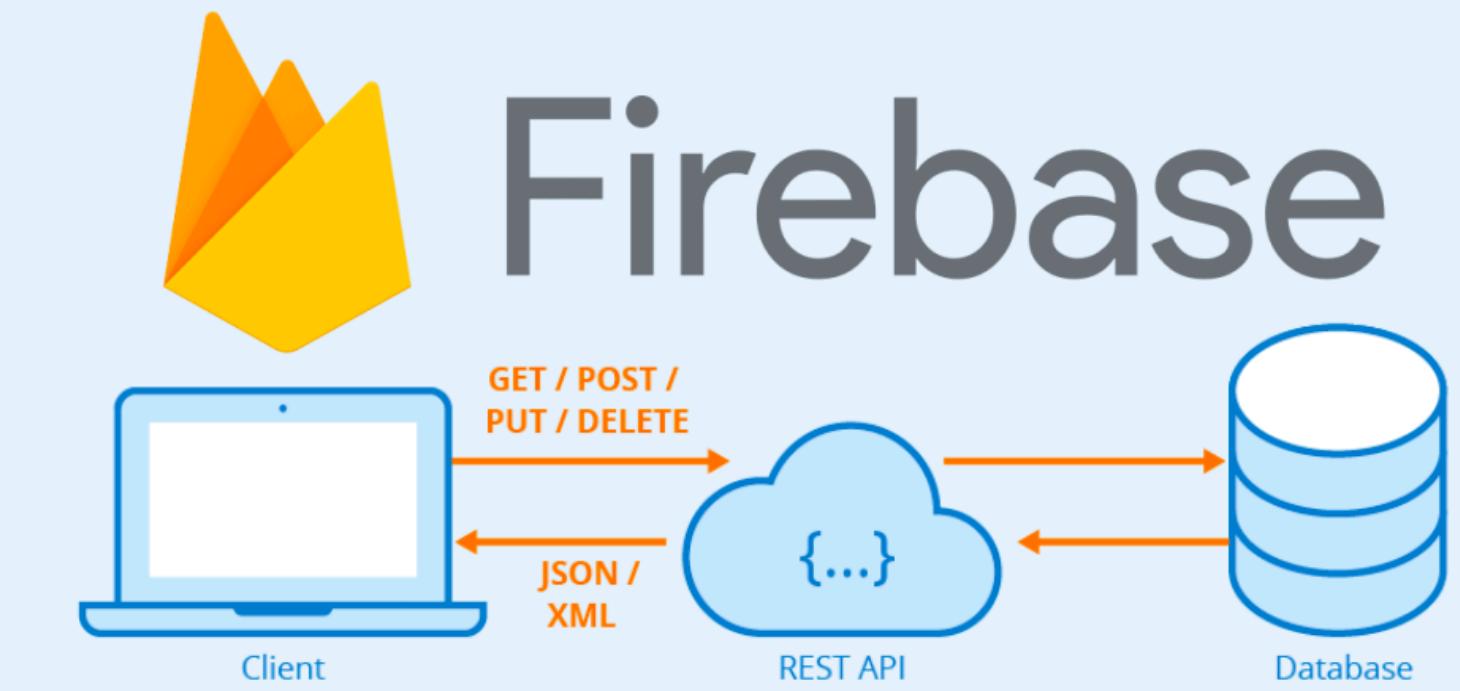

“

The Firebase Realtime Database is a cloud-hosted database. Data is stored as JSON and synchronized in realtime to every connected client.

We can use any Firebase Realtime Database URL as a REST endpoint. All we need to do is append .json to the end of the URL and send a request from our favorite HTTPS client.

”

<https://firebase.google.com/docs/database/rest/start>

How data is structured

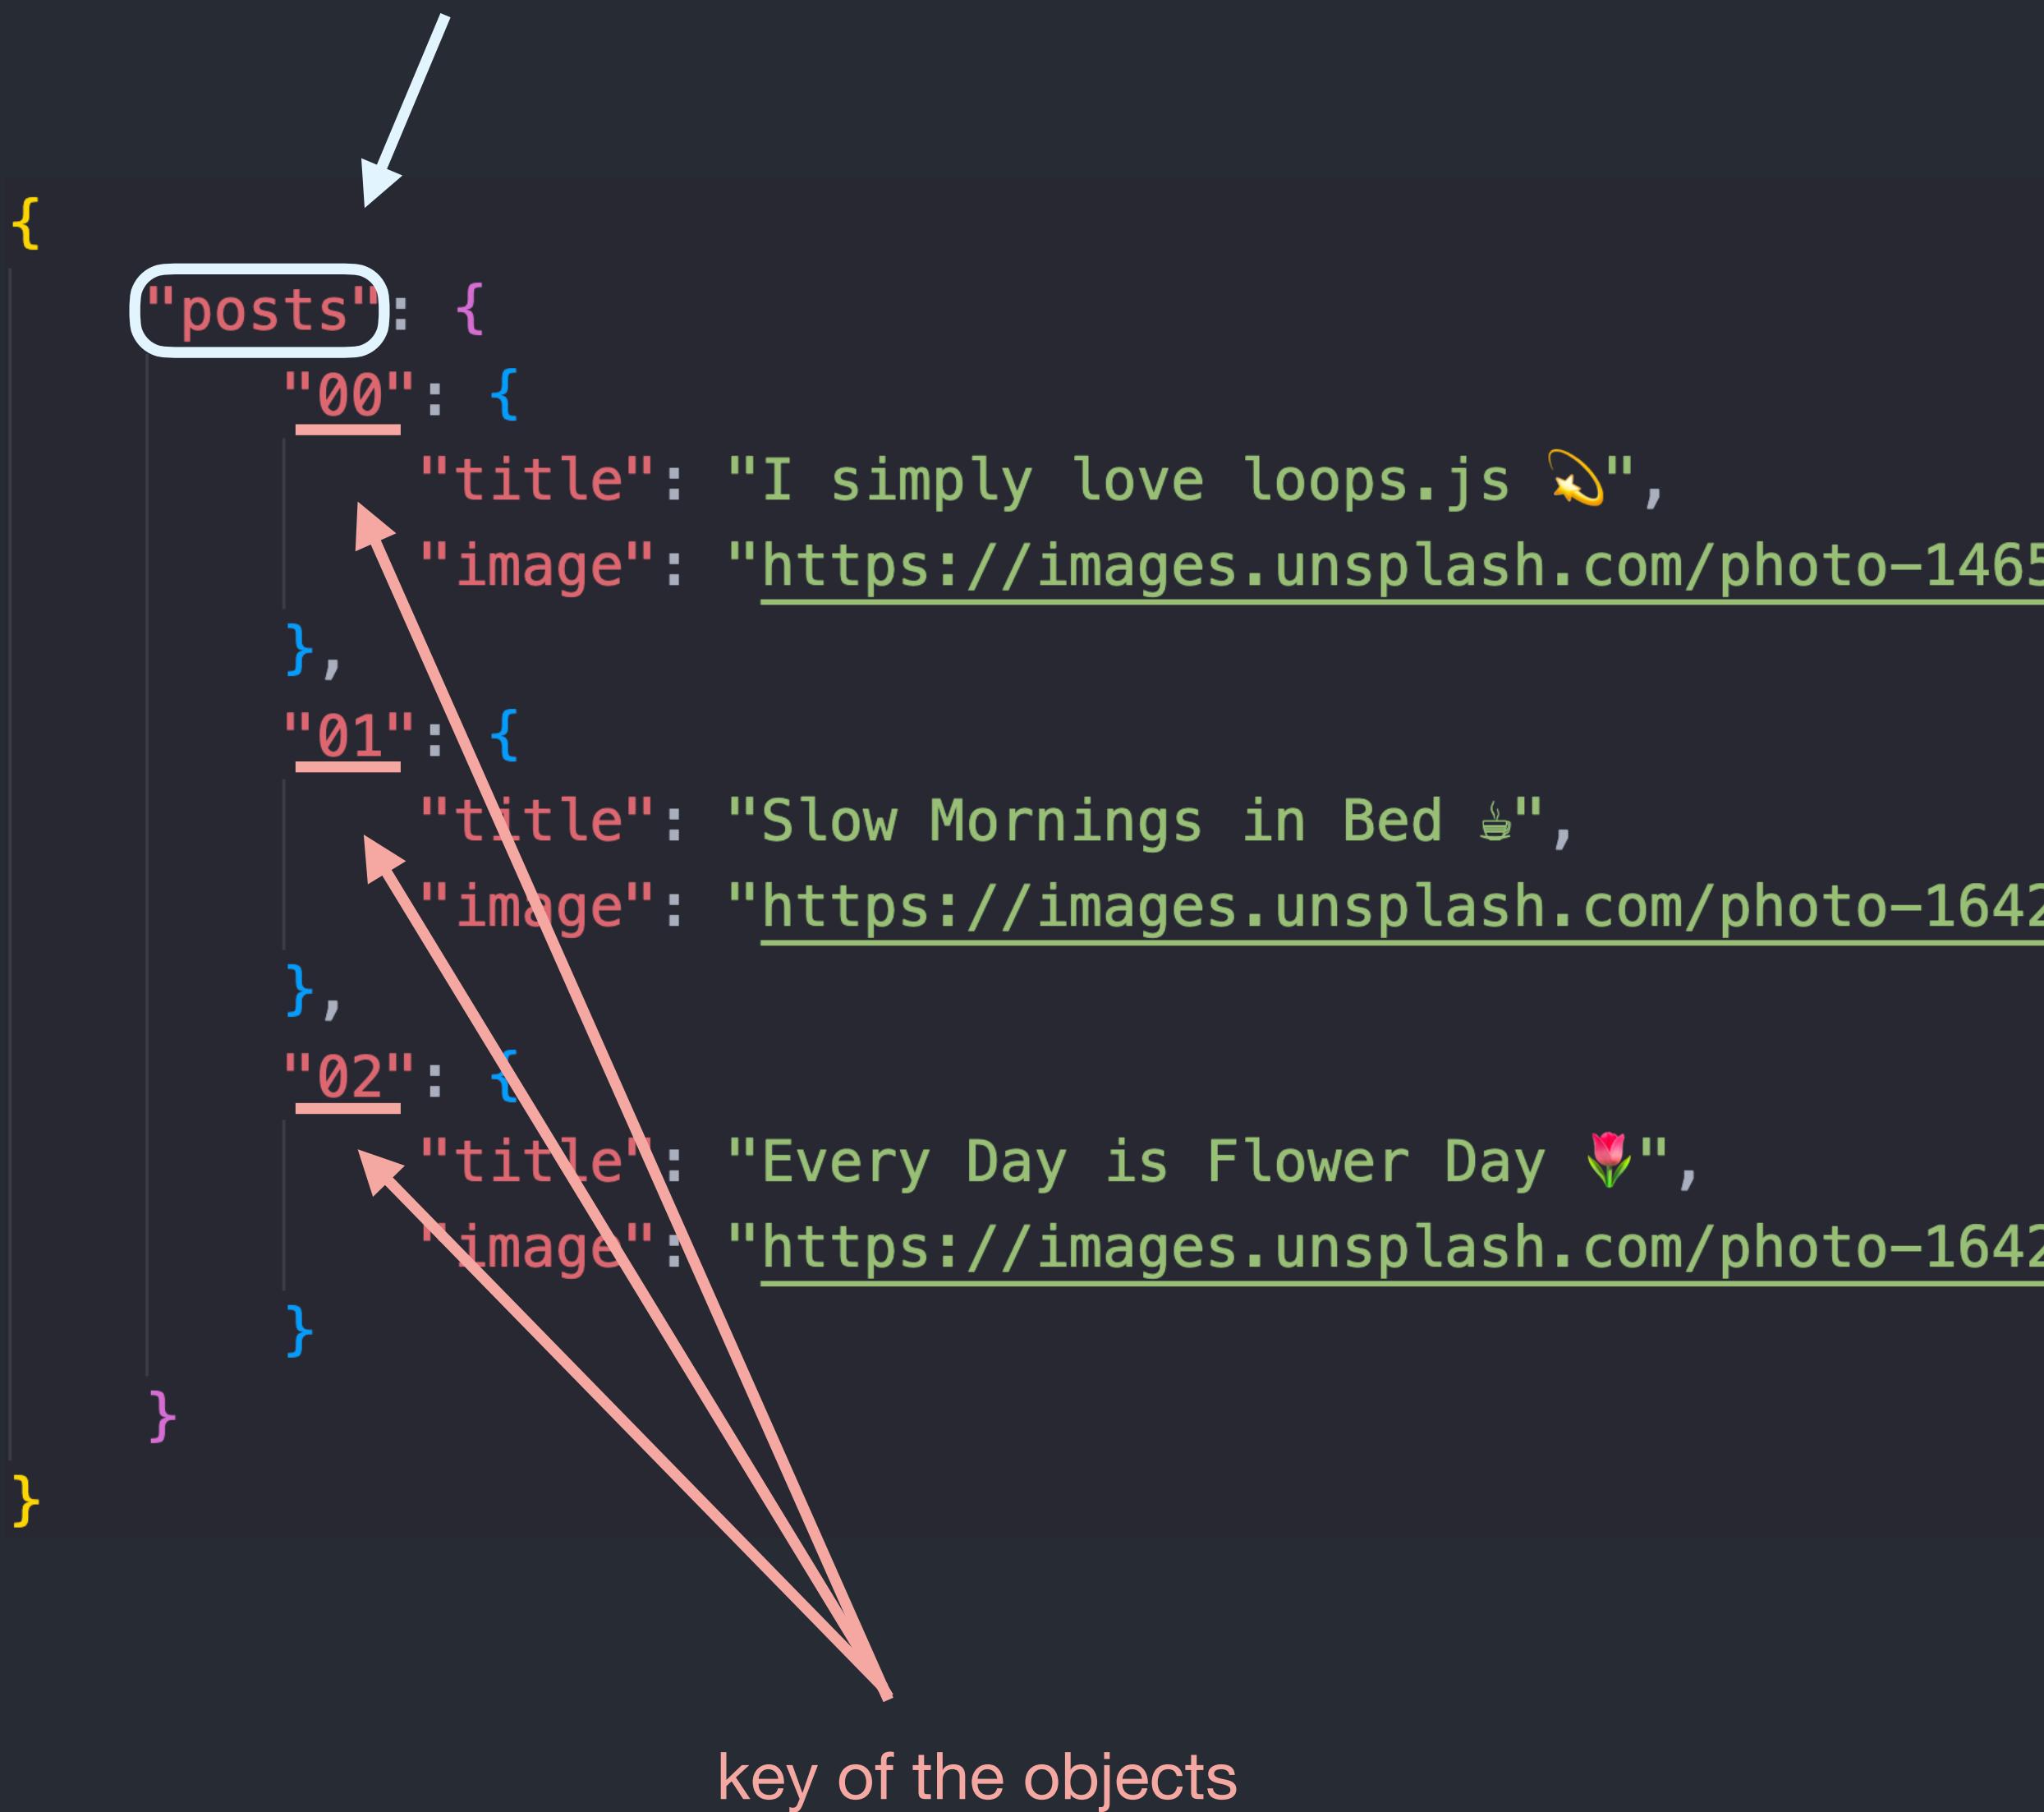

```
{  
  "posts": {  
    "00": {  
      "title": "I simply love loops.js 🌟",  
      "image": "https://images.unsplash.com/photo-1465...  
    },  
    "01": {  
      "title": "Slow Mornings in Bed ☕",  
      "image": "https://images.unsplash.com/photo-1642...  
    },  
    "02": {  
      "title": "Every Day is Flower Day 🌸",  
      "image": "https://images.unsplash.com/photo-1642...  
    }  
  }  
}
```

- One big object with objects.
- All objects have a unique key.
- “posts”, “00”, “01” and “02” are all keys.
- “posts” is the key of the collection of post objects (list of posts).
- “00”, “01” and “02” are keys of post objects.
- “title” and “image” are keys inside of every post object. “title” and “image” contains values.
- Remember a property contains a key and a value.

```
{  
  "posts": {  
    "00": {  
      "title": "I simply love loops.js 🌟",  
      "image": "https://images.unsplash.com/photo-1465...  
    },  
    "01": {  
      "title": "Slow Mornings in Bed ☕",  
      "image": "https://images.unsplash.com/photo-1642...  
    },  
    "02": {  
      "title": "Every Day is Flower Day 🌸",  
      "image": "https://images.unsplash.com/photo-1642...  
    }  
  }  
}
```

- Just think of an array of objects (posts array with post objects).
- We are just using an object to hold all the objects instead of an array.
- It's kind of a dictionary. The posts object contains unique property names (keys) which easily can be "looked up".
- Then every post object (with title and image props) can be returned:
 - `["posts"]["02"]`
 - `["posts"]["00"]`
 - `["posts"]["01"]`
 - `["posts"]["01"]["title"]`

key and name of the collections

- All posts: <https://post-rest-api-default.firebaseio.com/posts.json>
- One specific post: <https://post-rest-api-default.firebaseio.com/posts/00.json>
- And specific prop: <https://post-rest-api-default.firebaseio.com/posts/00/title.json>

key and name of the collections

{

"posts": {

"00": {

 "title": "I simply love loops.js 🌟",
 "image": "<https://images.unsplash.com/photo-1465110810000>

},

"01": {

 "title": "Slow Mornings in Bed ☕",
 "image": "<https://images.unsplash.com/photo-1642>

},

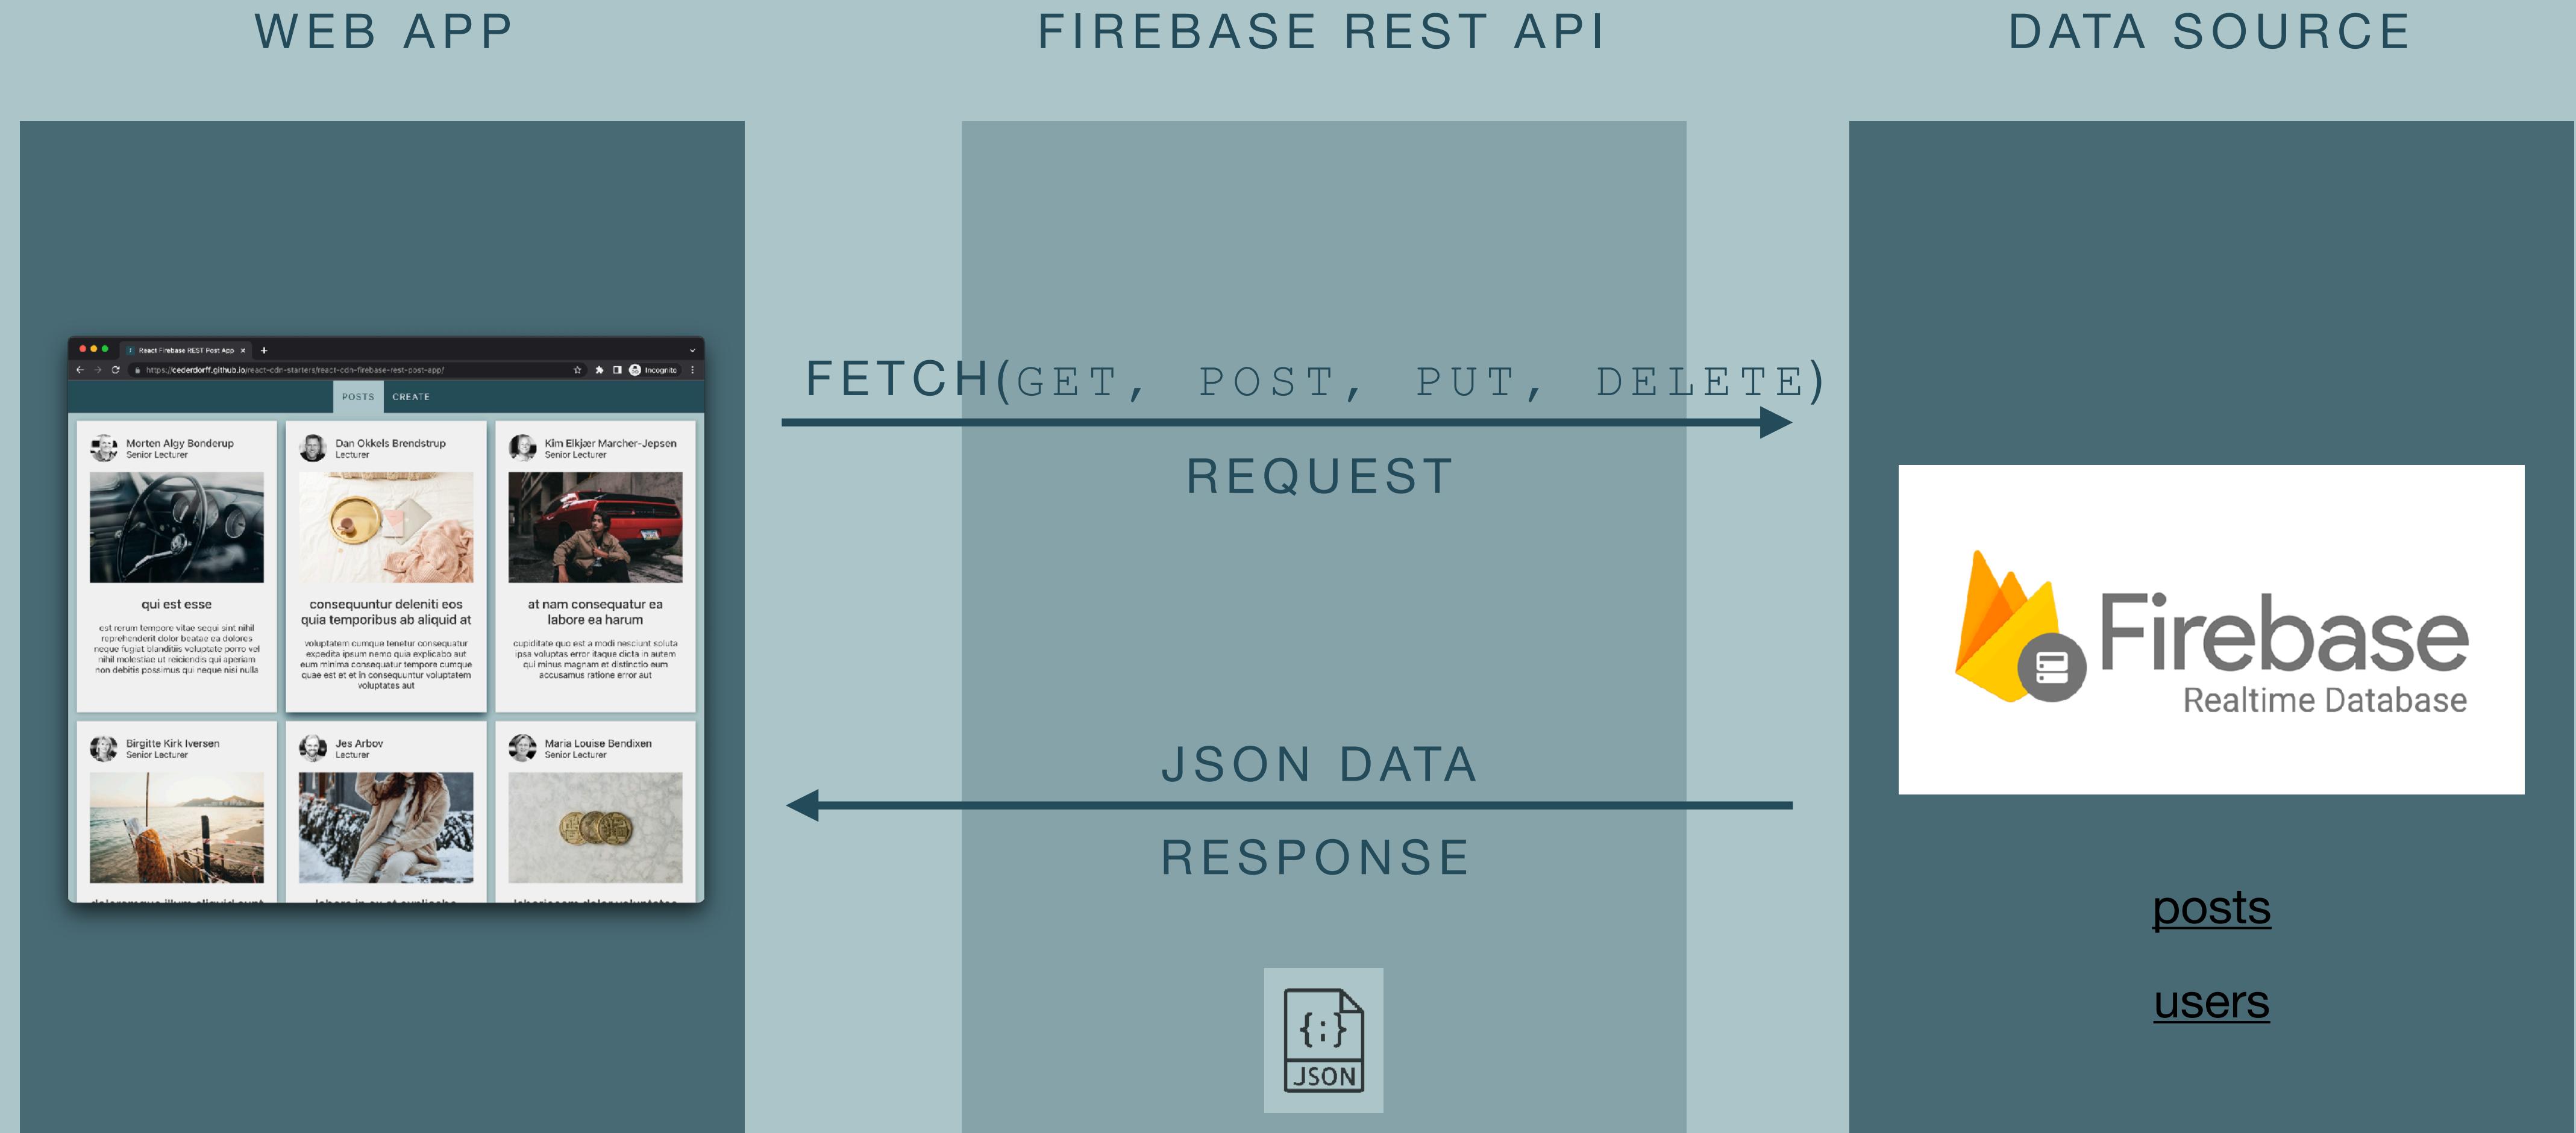

"02": {

 "title": "Every Day is Flower Day 🌸",
 "image": "<https://images.unsplash.com/photo-1642>

}

key of the objects

Fetch, HTTP Request & Response

Realtime Database REST API

[https://firebase.google.com/docs/
database/rest/start](https://firebase.google.com/docs/database/rest/start)

```
export default function PostsPage() {
  const [posts, setPosts] = useState([]);
  const [showLoader, dismissLoader] = useIonLoading();

  async function getPosts() {
    const response = await fetch("https://race-rest-default-rtbd.firebaseio.com/posts.json");
    const data = await response.json();
    // map object into an array with objects
    const postsArray = Object.keys(data).map(key => ({ id: key, ...data[key] }));
    return postsArray;
  }

  async function getUsers() {
    const response = await fetch("https://race-rest-default-rtbd.firebaseio.com/users.json");
    const data = await response.json();
    // map object into an array with objects
    const users = Object.keys(data).map(key => ({ id: key, ...data[key] }));
    return users;
  }
}
```
